ABSTRACT

This atlas contains charts depicting the distribution of physical, chemical, and biological oceanographic properties and associated meteorological properties observed during EASTROPAC. EASTROPAC was an international cooperative investigation of the eastern tropical Pacific Ocean (20° N. to 20° S., and from the west coasts of the American continents to 119° W.) which was intended to provide data necessary for a more effective use of the marine resources of the area, especially tropical tunas, and also to increase knowledge of the ocean circulation, air-sea interaction, and ecology. The Bureau of Commercial Fisheries (now National Marine Fisheries Service) was the coordinating agency. The field work, from February 1967 through March 1968, was divided into seven 2-month cruise periods. During each cruise period one or more ships were operating in the study area.

On completion of the field work the data seemed too numerous for a classical data report. Instead, it was decided to produce an 11-volume atlas of the results, with 5 volumes containing physical oceanographic and meteorological data from the principal participating ships, 5 volumes containing biological and nutrient chemistry data from the same ships, and 1 volume containing all data from Latin American cooperating ships and ships of opportunity. Extensive use was made of a computer and automatic plotter in preparation of the atlas charts. Methods used to collect and process the data upon which the atlas is based are described in detail by the contributors of the following categories of charts: temperature, salinity, and derived quantities; thickness of the upper mixed layer; dissolved oxygen; meteorology; nutrient chemistry; phytoplankton standing stocks and production; zooplankton and fish larvae; microneuston; birds, fish schools, and marine mammals.

ERRATA Number 2

December 1973

FIGURE 50-S-v5. The closed heavy contour at a depth of 50-100m in the vicinity of 1° - 2° S should be labeled 35.0. The heavy contour which intersects the sea surface at 2.2° N and 4.3° N should be labeled 34.0.

FIGURE 50-S-v6. The heavy contour which intersects the sea surface at 6.8° N and 7.7° N should be labeled 33.0.

FIGURE OP-S-v4. The dot at the sea surface near 10° N is not a contour and should be disregarded.

FIGURE OP-02-v1.
FIGURE OP-02-v3.
FIGURE OP-02-v4. The whole numbered contours (1.00, 2.00, etc.) on these charts have not been accented with heavier lines as is the case with other oxygen sections in this and other volumes.

FIGURE OP-02-v1. The contour at the top center of the chart should be labeled 5.50 instead of 55.0.

FIGURE OP-02-v3. Some of the contours near the surface are incorrectly labeled. The short contour at the very top, in the vicinity of 2° S should be labeled 5.25. The contour immediately below it should be labeled 5.00. The next contour down (the first one to extend across the whole section) should be labeled 4.75 instead of 4.50.

FIGURE 60-S-v3. The small heavy contour which intersects the sea surface twice in the vicinity of 15.6° N should be labeled 33.5.

INTRODUCTION

EASTROPAC was an international cooperative investigation of the eastern tropical Pacific Ocean which was intended to provide data necessary for a more effective use of the marine resources of the area, especially tropical tunas, and also to increase knowledge of the ocean circulation, air-sea interaction, and ecology. The National Marine Fisheries Service (NMFS)—the Bureau of Commercial Fisheries (BCF) at the time of the investigations—was the coordinating agency. The field work, from February 1967 through March 1968, was divided into seven 2-month cruise periods.

At a meeting of the EASTROPAC Coordinating Committee held at La Jolla in April 1968, it was decided that the data derived from the cruises were so numerous as to render classical data reports impractical and that a comprehensive atlas of the physical and biological results of the project should be produced instead. The atlas has been divided into 11 volumes, with five volumes containing physical oceanographic and meteorological data from the principal participating ships, five volumes containing biological and nutrient chemistry data from the same ships, and one volume containing all data from Latin-American cooperating ships and ships of opportunity.

Volume 8 contains biological and nutrient chemistry data collected by the principal participating ships and *Oceanographer* during the third and fourth monitor cruise periods: cruise 50, October–November 1967, and cruise 60, December 1967–January 1968. The companion volume presenting the corresponding physical oceanographic and meteorological data is volume 7. The locations of stations occupied by participating ships are shown in figure 50-TC and figure 60-TC.

Information concerning the history and organization of the EASTROPAC Project, a description of the cruises undertaken, the program of observations, the methods used for preparation of the charts, and remarks on the organization of the atlas is contained in volumes 1 and 4 with descriptions by the contributing scientists of the methods used to collect and process the data upon which the atlas charts are based.
