## INTRODUCTION

The Salmon Technical Team (STT), staff of the Pacific Fishery Management Council (Council), and National Marine Fisheries Service (NMFS) Southwest Region have prepared this postseason review of the 2009 ocean salmon fisheries off the coasts of Washington, Oregon, and California to help assess Council salmon management and to provide a detailed description of the affected environment for inclusion in a National Environmental Policy Act (NEPA) analysis of the 2010 management measures, if necessary. The STT and Council staff will provide three additional reports prior to the beginning of the ocean salmon season to help guide the Council's selection of annual fishery management measures. The reports will provide forecasts of stock abundance and analyze the impacts of the Council's proposed and adopted management recommendations. These reports will also document the analysis of alternatives for any NEPA analysis.

West Coast fisheries in Council-managed waters (ocean fisheries between the U.S./Canada border and the U.S./Mexico border from 3 to 200 nautical miles offshore) are directed toward and harvest primarily Chinook or king salmon, Oncorhynchus tshawytscha, and coho or silver salmon, Oncorhynchus kisutch. Small numbers of pink salmon, Oncorhynchus gorbuscha, also are harvested, especially in odd numbered years. There are no directed fisheries for other Pacific salmon species, which are rarely caught in Council-managed fisheries.

The Council's annual review of ocean salmon fisheries provides a summary of important biological and socioeconomic data from which to assess the impacts of past management actions, determine how well management objectives are being met, and improve regulations for the future. The Council will formally review this report at its March meeting prior to the development of management options for the approaching fishing season.

Chapter I summarizes ocean salmon fishery regulations and landings within the Council management area and management actions and landings under the jurisdiction of the Pacific Salmon Commission (PSC). Appendix A tables detail historical harvest data by state and by management area.

For Chinook and coho salmon, respectively, Chapters II and III assess, where possible, the achievement of pertinent management objectives by salmon stock (including those listed under the Endangered Species Act [ESA]), outline regulations to achieve the objectives, and summarize inside fisheries catch and spawner escapement data. Detailed information for other salmon species is not included, since Council fisheries have minor impacts on pink salmon escapements and no measurable impacts on sockeye or chum salmon or steelhead trout; however, catch and escapement data and objectives for Puget Sound pink salmon are summarized in Appendix B, Table B-42.

Socioeconomic impacts of the fisheries are discussed in Chapter IV. Appendices B through D provide historical data on inland landings and escapements, ocean regulations, and fishery-related socioeconomics, respectively.

The annual review of ocean salmon fisheries is drafted as early as analyses of landings and escapement data are available. The most recent entries are noted as preliminary and later updated when the data become final. If updated information or error corrections that could substantially affect the development of management measures for the upcoming season are available, an errata sheet will be included as an appendix in one of the subsequent STT preseason planning documents.

## COMMON TABLE CONVENTIONS

All 2009 data provided in this report are preliminary. The following conventions apply to all tables in this report:

1. Due to rounding, the total values may not equal the sum of individual values.
2. A single dash indicates there are no data appropriate for a particular table cell, or in the case of fishing effort or landings, that the season was closed.
3. A double dash indicates no records are available, for example, a fishery may not have been sampled due to low and sporadic effort.
4. "NA" indicates data are not available at the time of publication, but are likely to be available at a future date.

## CHAPTER I

## COASTWIDE OCEAN FISHING SUMMARY

Chapter I contains or references tables summarizing the current and historical ocean salmon fishing regulations and harvest data. In addition, this chapter provides a brief summary of the Council's regulatory objectives, by management area, for the most recent fishing year, reports on the results of the Council's selective fisheries for marked hatchery coho, and bycatch mortality of Chinook and coho salmon. The final section in the chapter provides a brief summary of management information and harvests under the authority of the PSC.

## COUNCIL-AREA REGULATIONS AND LANDINGS

Summaries of the 2009 regulations for non-Indian commercial troll, treaty Indian commercial troll, and recreational ocean salmon fishing in both the exclusive economic zone (EEZ) (3 to 200 nautical miles from shore) and state territorial waters ( 0 to 3 nautical miles from shore) are provided in Tables I-1, I-2, and I-3, respectively. Historical summaries of regulations for each of the three West Coast states and for treaty Indian troll fisheries are provided in Appendix C, Tables C-1 through C-7. Table C-9 provides a summary of inseason regulatory actions and events during the 2009 season.

Catch, quota, and fishing effort statistics are presented in the following series of tables:
Table I-4: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by state of landing.

Table I-5: Council area commercial and recreational ocean salmon fishing effort and landings of Chinook, coho, and pink salmon by management area.

Table I-6: The 2009 coho and Chinook quotas for each fishery compared with actual harvests.
Appendix A Tables A-1 through A-19: Historical monthly ocean salmon harvest data by state and port area.

Tables A-20 through A-28: Historical monthly ocean salmon harvest data by management area.
Appendix B Tables B-1 through B-43: Historical inside harvest and escapement data.
Appendix C Table C-8: Historical record of annual preseason catch quotas for the area north of Cape Falcon, as well as the stocks that were critical for ocean salmon management actions.

## REGULATORY OBJECTIVES BY MANAGEMENT AREA

The sections below provide a brief outline of the regulatory objectives that shaped the 2009 ocean salmon fisheries by management area and species. Further details of the conservation and allocation objectives by salmon stock and an assessment of performance are provided in Chapters II and III for Chinook and coho, respectively.

## Horse Mountain to U.S.IMexico Border

## Chinook Fisheries

Chinook fisheries management in this area is guided by conservation objectives for Sacramento River fall Chinook (SRFC), Klamath River fall Chinook (KRFC), and by NMFS ESA consultation standards for

Sacramento River winter Chinook, California Coastal Chinook, Lower Columbia natural (LCN) coho, Oregon Coastal Natural (OCN) coho, and Southern Oregon/Northern California Coastal (SONCC) coho. The Council structured 2009 Chinook salmon fisheries south of Horse Mountain (near Shelter Cove, California) to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for Federally-recognized tribal subsistence and commercial fisheries. The Council adopted the 40,700 management objective for 2008 and 2009 as a rebuilding strategy after that stock triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The Sacramento River winter Chinook ESA consultation standard requiring that the recreational season between Point Arena and Pigeon Point shall open no earlier than the first Saturday in April and close no later than the second Sunday in November; the recreational season between Pigeon Point and the U.S./Mexico Border shall open no earlier than the first Saturday in April and close no later than the first Sunday in October. The minimum size limit shall be at least 20 inches total length. Commercial seasons between Point Arena and the U.S./Mexico border shall open no earlier than May 1 and close no later than September 30, with the exception of a permissible October season conducted Monday through Friday between Point Reyes and Point San Pedro, which shall end no later than October 15. The minimum size limit shall be at least 26 inches total length.
4. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
5. The LCN coho ESA consultation standard requirement of no greater than a 20.0 percent exploitation rate (marine and mainstem Columbia River combined).
6. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN coho work group that was adopted by the Council as expert biological advice in November 2000.
7. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

Objective 1 was the constraining factor for 2009 Chinook fisheries management in this area, resulting in a complete closure of ocean salmon fisheries south of Horse Mountain (Tables I-1 and I-3). Under the adopted regulations, no Chinook were projected to be harvested south of Horse Mountain, and 122,050 SRFC were projected to spawn in hatcheries and natural areas. The SRFC escapement forecast of 122,050 adults takes into account recreational harvest from August 29-31 in the area between Humbug Mountain, Oregon and Horse Mountain, California, as well as non-retention impacts incurred from recreational coho fisheries in Oregon, totaling approximately 150 SRFC. In addition, the forecast assumed that zero SRFC would be harvested in 2009 Sacramento River recreational fisheries. The coast wide ocean harvest rate on age- 4 KRFC was projected to be 0.08 percent, and 40,700 KRFC adults were projected to spawn in natural areas.

## Coho Fisheries

Coho fisheries management for 2009 in this area was guided by the ESA consultation standard for central California coastal (CCC) coho, which prohibits retention of coho in this area. No projection of nonretention fishery impacts on CCC coho was available; projected non-retention exploitation rates on LCN, OCN and RK coho were zero in this area. Retention of coho has been prohibited south of Horse Mountain since 1996. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2009 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

## Humbug Mountain to Horse Mountain

## Chinook Fisheries

The area between Humbug Mountain (near Port Orford, Oregon) and Horse Mountain (near Shelter Cove, California) is referred to as the Klamath Management Zone (KMZ). Chinook fisheries management in this area is guided by conservation objectives for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2009 Chinook salmon fisheries in the KMZ to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for Federally-recognized tribal subsistence and commercial fisheries. The Council adopted the 40,700 management objective for 2008 and 2009 as a rebuilding strategy after that stock triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
4. The LCN coho ESA consultation standard requirement of no greater than a 20.0 percent exploitation rate (marine and mainstem Columbia River combined).
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN coho work group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objective 1 above was the constraining factor for 2009 Chinook fisheries management in the KMZ, resulting in a closure of Council-area commercial salmon fisheries and an extremely limited Chinookdirected recreational fishery in this area (Tables I-1 and I-3). Under the adopted regulations, for the recreational fishery between August 29 and September 7, 2009, the total Chinook harvest in the KMZ was estimated to be approximately 900 and the coast wide ocean harvest rate on age-4 KRFC was projected to be 0.08 percent. 40,700 KRFC adults were projected to spawn in natural areas.

## Coho Fisheries

Coho fisheries management in this area is guided by the ESA consultation standards for LCN, OCN, SONCC and CCC coho, which prohibits retention of coho south of the Oregon/California border. A
mark-selective recreational coho fishery was conducted from Cape Falcon to the Oregon/California border with an overall preseason quota of 110,000 marked coho (Table I-3). No projection of nonretention fishery impacts on CCC coho was available; projected non-retention exploitation rates on LCN, OCN and RK coho in this area were 0.1 percent, 0.6 percent and 1.4 percent, respectively. Coho are managed as a unit south of Cape Falcon, and details of the Council's management objectives shaping the 2009 fisheries are presented more fully in the Cape Falcon to Humbug Mountain section.

## Cape Falcon to Humbug Mountain

## Chinook Fisheries

Chinook fisheries management in this area is guided by conservation objectives for SRFC, KRFC, and by NMFS ESA consultation standards for California Coastal Chinook, LCN coho, OCN coho, and SONCC coho. The Council structured 2009 Chinook salmon fisheries in this area to meet the following objectives:

1. The SRFC spawner escapement goal of 122,000 to 180,000 hatchery and natural adults.
2. A Klamath basin natural area spawning escapement of no less than 40,700 fall Chinook adults and a spawner reduction rate of no more than 67 percent, along with the allocation objective of 50 percent of the allowable adult harvest for Federally-recognized tribal subsistence and commercial fisheries. The Council adopted the 40,700 management objective for 2008 and 2009 as a rebuilding strategy after that stock triggered an Overfishing Concern by failing to meet the FMP conservation objective of 35,000 natural area adult spawners in 2004, 2005, and 2006.
3. The California Coastal Chinook ESA consultation standard requiring a forecast KRFC age-4 ocean harvest rate of no greater than 16.0 percent.
4. The LCN coho ESA consultation standard requirement of no greater than a 20.0 percent exploitation rate (marine and mainstem Columbia River combined).
5. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group that was adopted by the Council as expert biological advice in November 2000.
6. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on RK hatchery coho.

Objective 1 above was the constraining factor on 2009 Chinook fisheries management resulting in a closure of Council-area Chinook-directed ocean fisheries in this area. Oregon scheduled late season terminal area fisheries (state waters only) near the mouth of Tillamook Bay and Elk River with a projected harvest of 600 Chinook (Tables I-1 and I-3).

## Coho Fisheries

Coho fisheries management in this area is guided by NMFS ESA consultation standards for LCN coho, OCN coho, and SONCC coho. The Council structured 2009 coho salmon fisheries in this area to meet the following objectives:

1. The LCN coho ESA consultation standard requirement of no greater than a 20.0 percent exploitation rate (marine and mainstem Columbia River combined).
2. The OCN coho allowable exploitation rate (marine and freshwater combined) of no greater than 15.0 percent as required by the exploitation rate matrix recommended by the OCN Coho Work Group which was accepted by the Council as expert biological advice in November 2000.
3. The SONCC coho ESA consultation standard requirement of no greater than a 13.0 percent marine exploitation rate on Rogue/Klamath (RK) hatchery coho.

The Council adopted seasons in this area were projected to have impacts of 3.2 percent, 7.4 percent, and 2.5 percent on LCN natural coho OCN coho and RK coho, respectively. In all Council area fisheries, projected impact rates were 12.5 percent, 13.0 percent, and 2.8 percent, respectively.

The Council's marine exploitation rate for LCN, OCN, and RK coho assumed a 14 percent hook-andrelease mortality rate in recreational fisheries and a 26 percent rate in commercial troll fisheries off Oregon and Washington.

The 2009 Oregon recreational coho selective fishery consisted of a June 20 - August 31 fishery from Cape Falcon to the Oregon/California border with a preseason quota of 110,000 marked coho, and a September 1-30 fishery from Cape Falcon to Humbug Mountain with a preseason quota of 7,000 which was modified inseason to 9,560 (Table I-3). Under the adopted regulations, the projected harvest impacts and non-retention mortality resulting from these fisheries to be equivalent to exploitation rates of 4.8 percent for OCN coho stocks, 2.5 percent for LCN coho, and 0.5 percent for RK coho. These fisheries were also projected to result in incidental mortality of approximately 100 SRFC.

In 2009, from Cape Falcon to Humbug Mountain, the commercial coho fishery had an overall quota of 21,240 ( 11,000 preseason plus transfer of additional coho from the recreational fishery quota on an impact neutral, fishery equivalent basis) (Table I-1). The fishery was not restricted to mark-selective coho retention. Under the adopted regulations, the projected harvest impacts resulting from this fishery to be equivalent to exploitation rates of 2.0 percent for OCN coho stocks, 0.6 percent for LCN coho, and 0.6 percent for RK coho.

## U.S./Canada Border to Cape Falcon

## Chinook Fisheries

Management objectives for Chinook fisheries in this area were to comply with NMFS ESA consultation standards for lower Columbia River (LCR) tule and Snake River wild (SRW) fall Chinook, meet treaty Indian sharing obligations and the allocation provisions in the Salmon FMP, provisions of the Pacific Salmon Treaty (PST), and to the extent possible, provide for viable ocean and inriver fisheries while meeting natural stock escapement objectives and hatchery fall Chinook brood stock needs. Columbia lower river hatchery (LRH) and Spring Creek Hatchery (SCH) fall Chinook have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon. The LCR natural tule Chinook ESA consultation standard was the primary constraint for 2009 ocean fisheries in this area.

The Council structured Chinook salmon fisheries between Cape Falcon, Oregon and the U.S./Canada Border to meet the following objectives (in order of most to least constraining):

1. The LCR natural tule Chinook ESA consultation standard requirement for a combined marine and freshwater exploitation rate of no greater than 38.0 percent.
2. The Snake River fall Chinook ESA consultation standard of at least a 30.0 percent reduction in the total ocean age-3 and age-4 AEQ exploitation rate from the 1988-1993 average.
3. For select Chinook stocks of concern to the Pacific Salmon Commission, keep the Individual Stock Based Management (ISBM) index at or below 60.0 percent of the 1979-1982 average.

The Council adopted 2009 harvest quotas of 20,500 Chinook for recreational fisheries, 20,500 Chinook for commercial non-Indian troll, and 39,000 Chinook for treaty Indian troll fisheries (Tables I-1, I-2, and I-3). Total allowable harvest set preseason for the non-Indian commercial and recreational fisheries for Chinook in 2009 was 41,000 , compared to 40,000 in 2008. The overall quota in the treaty Indian troll fishery was 39,000 Chinook compared to 37,500 in 2008. The 2009 ocean salmon fisheries were projected to have a 38.0 percent total AEQ exploitation rate on LCR natural tules ( 14 percent in Council area fisheries), and a 47.3 percent reduction from the base period AEQ exploitation rate for SRW.

## Coho Fisheries

Management objectives for coho fisheries in this area were to comply with NMFS ESA consultation standards for LCN and OCN coho, meet treaty Indian sharing obligations and the allocation provisions in the Salmon FMP, provisions of the PST, and to the extent possible, provide for viable ocean and inriver fisheries while meeting natural stock escapement objectives and hatchery coho brood stock needs. Columbia River early and late hatchery coho have historically been the major contributors to ocean fishery catches in the Council area north of Cape Falcon. The LCN coho ESA consultation standard was the primary constraint for 2009 ocean fisheries in this area.

The Council structured coho salmon fisheries to meet the following objectives (in order of most to least constraining):

1. The LCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 20.0 percent.
2. An exploitation rate on Interior Fraser coho of no more than 10.0 percent in southern U.S. fisheries in accordance with the provisions of the southern coho management plan adopted by the PSC in February, 2002.
3. The OCN coho ESA consultation standard requirement for a combined marine and mainstem Columbia River exploitation rate of no greater than 15.0 percent.
4. Meet inside/outside and treaty Indian/non-Indian allocation objectives.
5. Meet FMP objectives for allocation of impacts between commercial and recreational ocean fisheries, and among port areas for the recreational fishery.

The Council adopted a mark-selective recreational fishery quota north of Cape Falcon of 176,400 coho, with the requirement that all retained coho must be marked with healed adipose fin clip (Table I-3). The Council adopted commercial harvest quotas of 33,600 marked coho for the non-Indian commercial troll mark-selective fishery (Table I-1) and 60,000 coho for the treaty Indian troll fishery (Table I-2), which was not mark-selective. Total allowable harvest set preseason for the non-Indian commercial and recreational fisheries for coho in 2009 was 210,000 , compared to 24,350 in 2008. For the treaty Indian fishery the overall quota of 60,000 coho was greater than the 20,000 coho quota in 2008. The 2009 ocean salmon fisheries were projected to have a 20.0 percent total exploitation rate on LCN coho ( 12.5 percent in Council area fisheries), an exploitation rate in southern U.S. fisheries of 9.8 percent on Interior Fraser (Thompson River) coho ( 6.2 percent in Council area fisheries), and a total exploitation rate of 13.0 percent on OCN coho ( 9.4 percent in Council area fisheries).

## SELECTIVE FISHERIES AND SALMON BYCATCH

Estimated incidental Chinook and coho mortalities are reported in Tables I-7 and I-8. Unless otherwise noted, Chinook mortality estimates from north of Cape Falcon and coho mortality estimates coastwide were based on preliminary postseason model runs incorporating final ocean catch numbers and updated Columbia River run-sizes; Chinook mortality estimates south of Humbug Mountain, Oregon are based on expansion of dockside sampling data. Under the Sustainable Fisheries Act, incidental mortality in commercial fisheries constitutes bycatch mortality, but incidental mortality resulting from the nonretention recreational fisheries does not.

## Selective Chinook Fisheries

No mark-selective Chinook fisheries were conducted in Council-area fisheries in 2009, however, two Oregon state waters terminal area recreational fisheries had mark-selective requirements (Table I-3).

In 2009, recreational fisheries in the Strait of Juan de Fuca operated under mark-selective retention restrictions for both Chinook and coho in Area 5 and the portion of Area 6 west of Port Angeles, from July 1 through August 6. As in 2008, the Areas 5 and 6 mark-selective fisheries were managed on season rather than quota-based criteria. After August 6, the fisheries in Areas 5 and 6 remained open for marked coho only (no Chinook retention) through September 18; Area 5 operated under non-selective fishing regulations for coho from September 19 through September 30 while Area 6 remained selective for marked coho through September 30. Catch and release estimates, derived from creel census programs conducted during the mark-selective fishery in Area 5 from July 1 through September 18 are presented in Table I-9. No inseason estimate was made for Area 6, which was open from July 1 through August 6 for mark-selective Chinook fishing.

Mark-selective Chinook fisheries were also held in Puget Sound Area 9 from July 16 through August 31, in Area 10 from July 16 through August 31, in Area 11 June 1 through September 30, and in Area 13 May 1 through September 30. Winter mark-selective fisheries were held in Area 7 from February 1 through April 15, 2009 and December 1, 2009 through April 30, 2010. Winter mark-selective Chinook fisheries were held in Areas 8-1 and 8-2 January 1 through April 30, 2009 and November 1, 2009 through April 30, 2010. Area 9 had mark-selective Chinook opportunity from January 16 through April 15, 2009 and all of November 2009 and January 16 through April 15, 2010. Area 10 had mark-selective Chinook fisheries from December 1, 2008 through January 31, 2009 and October 1, 2009 through January 31, 2010.

## Selective Coho Fisheries

Recreational fisheries selective for marked coho were planned for the area between Cape Falcon and the Oregon/California border, the four ocean subareas north of Cape Falcon, and the inside fisheries at Buoy 10 and the Strait of Juan de Fuca (Areas 5 and 6). Numerous other Puget Sound, inside, and freshwater recreational fisheries in Washington and Oregon had mark-selective restrictions for coho. Non-Indian commercial fisheries selective for marked coho were planned for the area between the U.S./Canada border and Cape Falcon. Preseason and inseason assessments of mark rates, catches, numbers of coho released, and incidental (bycatch) mortality for Council-area and some mixed stock inside fisheries are summarized in Table I-8. Fisheries were sampled by a combination of on-water observers and dockside interviews. The observed mark rates both north and south of Cape Falcon were lower than predicted preseason.

## PACIFIC SALMON COMMISSION

The PSC was established to implement the 1985 Pacific Salmon Treaty (PST) between the United States and Canada. Because many of the stocks under the jurisdiction of the Council are significantly affected by management actions taken in Canadian and Alaskan waters, considerable interaction between the

Council and the PSC occurs at both the policy and technical levels. Actual catches for PSC fisheries of the most relevance to the Council are summarized in Tables I-10 and I-11. Note that these catch statistics do not correspond to provisions of the PST for compliance with aggregate abundance-based management (AABM; see below); nor do they reflect incidental mortality losses associated with the regulation of these fisheries, except as noted.

## Chinook Fisheries

Northern British Columbia (B.C.) and Southeast Alaska (SEAK) fisheries affect far-north migrating Chinook stocks from Washington, Oregon, and Idaho. These include Washington coastal stocks; Columbia and Snake River bright fall and summer stocks; and far-north migrating Oregon coastal Chinook stocks.

The West Coast Vancouver Island (WCVI) troll and Georgia Strait troll and recreational fisheries affect far-north migrating stocks (including LRW) to a lesser degree, but have a major impact on more southerly distributed Columbia River tule and Puget Sound stocks.

In June 1999, the United States and Canada reached agreement on a framework for Chinook fishing regimes for 1999 through 2008. Under this agreement, SEAK (all gear), northern B.C. (troll and recreational), and WCVI (troll and outside recreational) fisheries were regulated under aggregate AABM regimes. These fishery regimes had catch ceilings derived from indices for total aggregate abundance of stocks contributing to specific components of the fisheries and target fishery harvest rates. For example, the allowable catch for WCVI troll and outside sport fisheries were determined by the abundance index estimated for the WCVI troll fishery. The allowable catch for the WCVI AABM fisheries was designed to reduce harvest rates for the combined troll and outside sport fisheries by approximately 35 percent from levels observed during 1985 through 1996. Provisions of a new agreement, ratified in 2008, took effect January 1, 2009. The 2008 agreement reduces catch ceilings in SEAK and WCVI AABM fisheries by 15 percent and 30 percent respectively, from those in the 1999 agreement. The United States and Canada are developing management regimes for AABM fisheries based on total mortality rather than landed catch.

For fisheries not driven by AABM regimes, including Council area fisheries, the 1999 agreement established conservation obligations to reduce harvest rates on depressed Chinook stocks (those not meeting escapement goals) by 36.5 percent for Canadian fisheries and 40 percent for United States fisheries, relative to levels observed during 1979 through 1982. This individual stock based management (ISBM) obligation was taken into account during Council and inside fisheries preseason management planning processes.

In 2009, AABM fisheries were conducted in accordance with the obligations set forth in the 2008 PST agreement. SEAK fisheries were constrained by an all-gear catch ceiling of 218,700 "treaty" Chinook in 2009, an increase from the ceiling of 170,000 in 2008, but 15 percent less than it would have been under the 1999 agreement. "Treaty" Chinook are those fish that are counted against the AABM catch ceiling; they represent total catch minus terminal exclusions (fish taken in terminal net fisheries where escapement goals are achieved) and hatchery add-ons (fish attributed to production from Alaskan hatchery facilities in excess of levels observed prior to the 1985 PST). The preliminary estimate of 2009 total catch of Chinook by SEAK fisheries was 272,467, while the catch of "treaty" Chinook was 214,451 (Table I-10).

The catch ceiling for the Northern B.C. AABM fisheries (Northern B.C. troll plus Queen Charlotte Islands sport) in 2009 was 143,000, compared to a ceiling in 2008 of 124,800 Chinook. The actual catch
was estimated at 109,470 ( 75,470 troll plus 34,000 sport). The entire NBC troll fishery in 2009 was conducted under a system of individual transferable quotas.

In addition to the overall catch ceiling determined by the PST, Canada's principal management objectives for the 2009 WCVI Chinook fisheries were to meet domestic allocation objectives as well as address concerns for Lower Strait of Georgia Chinook, WCVI Chinook stocks, spring run upper Fraser River Chinook, and Interior Fraser (Upper Fraser and Thompson) coho. The total allowable catch by WCVI AABM fisheries under the 2008 PST Agreement was 107,800 while the reported catch was 125,488 ; 53,191 troll, 3,381 First Nations, and 68,916 recreational (Table I-11).

In total, 13 openings occurred for the WCVI troll fishery (Table I-12) in accounting year 2009 (October 2008 through September 2009). Fisheries were closed from March 16 through April 19 to protect Fraser spring stocks. This closure continued in offshore areas of SW Vancouver Island through May 15 and only partial openings were permitted after that. The full WCVI was again closed June 16 and remained closed through the month of July to protect Fraser spring/summer stocks. During August, gear was restricted to large plugs to reduce coho contacts and the nearshore waters were closed to protect local WCVI Chinook stocks. To protect Interior Fraser coho, coho retention was mark-selective and revival tanks were required for released coho. September fisheries were closed because the total WCVI catch ceiling had been exceeded.

The WCVI outside sport fishery (the area where non-local stocks predominate) operated under a 45 cm (17.7 inches) total length minimum size limit, but with the additional restriction that Chinook over 77 cm (30.3 inches) could not be retained in the surfzone corridor (within 1 mile of shore) to protect local-origin stocks. The fishery harvested 68,900 fish, an increase of about 40 percent from the 2008 catch.

Catch estimates for all Canadian ISBM fisheries in northern B.C. were incomplete; the reported Chinook catch in 2009 was approximately 6,000 by commercial gillnets. Approximately 3,200 Chinook were caught by anglers from lodges in Rivers Inlet, Hakai Pass, and Bella Bella. Surveys of private angler catch were not conducted, but were believed to be less than the lodge catch. Tidal area sport catch estimates near the mainland coast of Northern B.C. in 2009 were not available. Catches by First Nations were 13,100 Chinook for the North Coast and 4,000 for the Central Coast.

Canadian ISBM fisheries in Southern B.C. in 2009 harvested a total of 133,900 Chinook (111,400 sport, 44,200 First Nations, and 9,800 commercial).

No direct management measures for Chinook salmon within the Council management area were specified under the 2008 PST agreement, except for the ISBM commitment. The Council's ocean fisheries and inside fisheries conducted by the state and tribal managers were designed to minimize impacts on spawning escapements of depressed stocks and preseason estimates of impacts were in compliance with terms of the PST agreement. Information necessary to evaluate the postseason impacts of Council area fisheries was not available.

## Coho Fisheries

In 2002 the PSC adopted a management plan for coho salmon originating in Washington and southern B.C. river systems. The plan is directed at the conservation of key management units, four from southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the United States and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status (low, moderate, and abundant) and target exploitation rates of the key management units as determined by domestic
managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan.

The forecast of 2009 abundance indicated that the status of interior Fraser River coho remained critically low. The lower Fraser, Georgia Basin, and the Johnstone Strait coho management units were all forecast to be at low or critical status.

In 2009, Canada's coho management objective was to constrain the exploitation rate by its fisheries on Thompson coho (a component of the Interior Fraser management unit) to a ceiling of 3 percent. Unmarked coho were released in many Southern B.C. commercial and sport fisheries where Thompson coho were known to be prevalent. Estimated release mortality rates for legal size coho by gear type were: Seine 25 percent; Northern Gillnet 70 percent; Southern Gillnet 60 percent; Troll 26 percent; and Sport 10 percent (Canadian Stock Assessment Secretariat, Research Document 99/128). Only terminal area fisheries along the WCVI and small portions of upper Johnstone Strait and the Queen Charlotte Islands were permitted for a short period to retain coho with intact adipose fins. Selective fishing techniques, such as barbless hooks for trollers, seine bunt restrictions, and use of revival tanks, were required. A total of 934 coho were retained by commercial fisheries in 2009 ( 6 troll, and 928 net). Coho kept and released by marine commercial fisheries in Southern B.C. are summarized in Table I-13.

For recreational fisheries, mark-selective coho retention was permitted in mixed stock areas, and barbless hooks were required. Mark-selective fisheries were implemented in most of Southern B.C. (Johnstone Strait, Strait of Georgia, Juan de Fuca Strait, and WCVI). The estimated total retained catch of coho in Southern B.C. marine recreational fisheries in 2009 was 117,300 . Coho kept and released by marine recreational fisheries in Southern B.C. are summarized in Table I-14.

First Nations fisheries in Southern B.C. were estimated to have harvested 24,200 coho.

a/ The overall quotas for these fisheries during the May 1-Sept. 15 ocean salmon management period were 39,000 Chinook and 60,000 coho. These quotas include troll catches by the S'Klallam and Makah tribes in Washington State Statistical Area 4B from May 1-Sept. 15. The overall Chinook quota was divided preseason to provide 19,000 Chinook for the May 1-June 30 Chinook-directed season and 20,000 Chinook for the July 1-Sept. 15 all-salmon season. Barbless hooks were required in all ocean fisheries.
b/ Minimum length limit 22 inches prior to May 1 and after October 31.
c/ Retention of steelhead prohibited; retention of chum prohibited prior to September 30.

| June 20-Aug. 31 (73 days) | All Except Chinook | None | 70,000 ${ }^{\text {g }}$ | Three salmon daily. Fishing in the Stonewall Bank groundfish conservation area restricted to trolling only on days the all depth recreational halibut fishery is open. ${ }^{\mathrm{h} /}$ |
| Sept. 1-30 (30 days) | All Except Chinook | None | 9,560 ${ }^{\text {i/ }}$ | Two salmon daily. Fishing in the Stonewall Bank groundfish conservation area restricted to trolling only on days the all depth recreational halibut fishery is open. ${ }^{\text {h/ }}$ |

TABLE I-3. Summary of actual ocean recreational salmon fishing regulations for 2009. (Page 3 of 3 )
Area and Season $\quad$ Salmon Species $\frac{\text { Actual Quota }}{\text { Chinook } \quad \text { Coho }^{\text {a/ }}}$ Daily Limit and Special Restrictions ${ }^{\text {b/ }}$ a/ All coho fisheries and quotas are mark-selective for fish with a healed adipose fin clip.
b/ No more than one rod and single-point, single-shank barbless hooks required north of Pt. Conception, CA. No more than two single-point, single-shank barbless hooks when fishing for salmon or fishing from a boat with salmon on board between Pt. Conception and Cape Falcon, OR. If angling by any means other than trolling between Pt. Conception and Horse Mt., CA, no more than two single-point, single-shank, barbless circle hooks shall be used. The distance between the two hooks must not exceed 5 inches when measured from the top of the eye of the top hook to the inner base of the curve of the lower hook, and both hooks must be permanently tied in place (hard tied). Unless otherwise noted: minimum size limits are (1) 24 inches for Chinook and 16 inches for coho north of Cape Falcon, and (2) 20 inches for Chinook and 16 inches for coho south of Cape Falcon. c/ 18,350 preseason quota minus transfers of 1,250 and 1,000 to La Push.
d/ 4,480 preseason quota plus transfers of 1,250 and 1,000 from Neah Bay and 1,250 from Westport.
e/ 65,270 preseason quota minus transfers of 1,250 to La Push and 8,750 to Columbia River.
f/ 88,200 preseason quota plus impact neutral transfer of 8,300 from Westport.
g/ 110,000 preseason quota for June-August Cape Falcon to OR/CA border fishery minus 14,000 impact neutral rollover to the September Cape Falcon to Humbug Mt. recreational fishery and 26,000 impact neutral transfer to the September Cape Falcon to Humbug Mt. commercial fishery.
h/ The all-depth halibut fishery was open on May 14-16, 21-23, 28-30, June 4-6, 18-20, July 2-4, and August 7-9.
i/ 7,000 preseason quota plus 2,560 impact neutral rollover from the June-August Cape Falcon to OR/CA border recreational fishery.

a/ For Washington, commercial effort and landings include: (1) treaty Indian fisheries (ocean and Area 4B only from May 1-Sept. 30) beginning in 1972; (2) prior to 1978, catch off British Columbia landed in Washington; (3) catch off Alaska landed in Washington; and (4) catch off Oregon and California beginning in 1976. Treaty Indian effort is in deliveries. Beginning in 1989, recreational angler trips and catch include state-managed, late-season Area 4B fishery when open (see Table IV-15).
b/ Recreational effort and catch includes Washington-based effort and catch from Oregon state waters (July 26-Aug. 1) and Strait of Juan de Fuca after WDFW and NMFS ocean closures in 1982
c/ Preliminary.
d/ Oregon commercial troll landings include small numbers of salmon caught in Alaska (prior to 1990), Washington, and California. Oregon recreational effort data are total angler trips prior to 1979 and salmon trips beginning in 1979. Significantly reduced salmon per angler trip in 1994-1998 reflects regulations requiring nonretention of coho in the recreational fishery south of Cape Falcon.
e/ California commercial effort and landings include salmon caught off Oregon and landed in California, which were minor and infrequent until 2004, when 200 days fished and
25,300 Chinook were included.

a/ The bycatch mortality reported in this table consists of drop-off mortality (includes predation on hooked fish) plus hook-andrelease mortality of Chinook and coho salmon in Council-area fisheries. Drop-off mortality for both chinook and coho is assumed to be equal to $5 \%$ of total encounters. The hook-and-release mortality (HRM) rates used for both chinook and coho are:
Commercial: 26\%.
Recreational, north of Pt. Arena: 14\%.
Recreational, south of Pt. Arena: $16 \%$ (based on the expected proportion of fish that will be caught using mooching versus trolling gear, and the HRMs of $42.2 \%$ and $14 \%$ for these two respective gear types).
b/ Bycatch calculated as dropoff mortality plus fish released.
c/ Includes Oregon territorial water, late season Chinook fisheries.
d/ Based on reported released Chinook.
e/ Includes fisheries that allow retention of all legal sized coho.
f/ Based on preliminary post-season model run incorporating final ocean catches and updated Columbia river run sizes.

TABLE I-8. Summary of 2009 recreational and commercial fisheries selective for marked hatchery coho (preliminary data).

a/ Hook-and-release plus drop-off mortality of unmarked fish.
b/ Calculated from observed mark rates where available; where unavailable, anticipated mark rates are used. La Push, Neah Bay, Cape Falcon-OR/CA border, and Buoy 10 recreational fishery observed mark rates based on dockside sampling
c/ Recreational effort measured in angler trips, commercial effort measured in days fished.
d/ Includes Area 5 (July 1 - September 18, 2009) selective fishery only. Data are preliminary.
e/ Expected catch, not a quota.

## CHAPTER II

## CHINOOK SALMON MANAGEMENT

## CENTRAL VALLEY CHINOOK STOCKS

Central Valley Chinook stocks include fall, late-fall, winter, and spring stocks of the Sacramento and San Joaquin rivers and their tributaries. Two of these stocks are listed under the ESA: (1) Sacramento River winter Chinook, listed as endangered in January 1994; and (2) Central Valley spring Chinook, listed as threatened in September 1999.

## Management Objectives

The following conservation objectives guided Council management of Central Valley Chinook salmon stocks in the 2009 fisheries: (1) for SRFC, an escapement goal of 122,000 to 180,000 hatchery and natural adults; and (2) for Sacramento River winter and Central Valley spring Chinook, the ESA consultation standard concerning the duration and timing of the commercial and recreational ocean salmon fisheries south of Point Arena.

## Regulations to Achieve Objectives

Harvest impacts on SRFC were the primary management concern in fisheries south of Cape Falcon, Oregon. In 2009, nearly all Chinook-directed fisheries occurring south of Cape Falcon were closed. Under the 2009 regulations, the projected escapement to the Sacramento River was 122,050 fall Chinook adults.

Season and size limit details are presented in Tables I-1 and I-3.

## Inside Harvest

Recreational angling for salmon in Central Valley rivers was highly restricted in 2009, with most times and areas closed to salmon retention. In 2008 and 2009 an upper Sacramento River recreational fishery targeting Sacramento River late-fall Chinook was conducted. The 2008 fishery occurred from November 1, 2008 through December 31, 2008 and an estimated 52 SRFC were harvested (an additional 85 SRFC were estimated to be harvested in the Feather River in June 2008, resulting in a total SRFC inriver harvest of 137 adults in 2008). In 2009, the upper Sacramento River late-fall run fishery was the only Central Valley fishery open to Chinook retention and, in an attempt to decrease harvest of SRFC, the fishery was not opened until November 16, 2009. Preliminary estimates indicate that zero SRFC were harvested in the 2009 late-fall fishery. Since 1990, regulations have closed the mainstem Sacramento River to retention of salmon from January 15 to July 15, a period when winter Chinook adults are thought to be most abundant. Beginning in 2004, the retention closure was enacted earlier, on January 1 from the Carquinez Bridge to Red Bluff, in response to recovery of winter Chinook coded-wire-tags (CWTs) in the sport fishery. In response to the low escapements in the Stanislaus, Tuolumne, and Merced rivers during the last decade, the majority of the San Joaquin River has been closed to recreational salmon fishing.

## Escapement and Management Performance

## Sacramento River Fall Chinook

In 2009, a total of 39,530 natural and hatchery SRFC adults were estimated to have returned to the Sacramento River basin for spawning (Table II-1, Figure II-1). The 2009 adult escapement estimate is the lowest on record and continues the declining trend in SRFC escapement despite the 2008 and 2009 closures of nearly all ocean Chinook fisheries south of Cape Falcon and Central Valley Chinook fisheries
targeting SRFC. SRFC have failed to meet the lower bound of the FMP conservation objective of 122,000 to 180,000 hatchery and natural adults for the third consecutive year, thereby triggering an Overfishing Concern under the terms of the FMP. Fall Chinook returns to Sacramento River hatcheries totaled 17,435 adults. Adult hatchery return goals were met at Feather River and Nimbus hatcheries, but not at Coleman National Fish Hatchery; however, egg take goals were met at each of these hatcheries. Available data indicate hatchery-produced fish constitute a majority of the Sacramento River naturally spawning fall Chinook population. In 2009, 22,095 SRFC adults spawned in natural areas. Table II-1 and Figure II-1 display historical natural and hatchery fall spawner escapement estimates. For a more detailed breakdown of the historical escapement see Appendix B, Tables B-1 and B-2.

## Sacramento River Winter and Spring Chinook

Spawner escapement of endangered winter Chinook salmon in 2009 was estimated to be 4,483 adults and 54 jacks. This estimate is derived from a carcass survey conducted on the upper Sacramento River. Spawner escapement estimates derived from Red Bluff Diversion Dam counts have been made since 1967, and from 1987 to 2008 the estimates were derived by expanding counts made during the period of dam operation (which overlaps with approximately 15 percent of the winter run migration period). In 2009, the period of dam operation was delayed by one month which did not allow for a winter run escapement estimate to be made based on Red Bluff Diversion Dam passage (the gates at Red Bluff Diversion Dam were down beginning on June 15, 2009, whereas the gates are down typically on May 15). However, even during years with typical Red Bluff Diversion Dam operation timing, the estimates from the carcass survey are considered to better represent winter run spawner escapement owing to the small proportion of the winter run migration sampled during the Red Bluff Diversion Dam operation period.

Escapement of spring Chinook to the Sacramento River system in 2009 totaled 4,506 fish (jacks and adults), most of which (an estimated 3,517 fish) returned to the upper Sacramento River tributaries; the remaining 989 fish returned to the Feather River Hatchery. No estimate of spring Chinook escapement to the Sacramento River could be made in 2009 due to the changes in Red Bluff Diversion Dam operation described above for winter Chinook. The method used to estimate the spring Chinook return to the Feather River Hatchery was modified in 2005. In previous years, the estimate was equal to the number of Chinook that entered the hatchery during the early period of Chinook spawning. From 2005 through 2009, prior to the spring run spawning period, fish that entered the hatchery were tagged and returned to the river; the number of tagged fish that re-entered the hatchery during the spring run spawning period was used as the estimate of spring Chinook escapement in the Feather River. The fish that were tagged at the hatchery and returned to the river but did not re-enter the hatchery during the spawning period were counted in the natural fall run survey and reported as Feather River fall Chinook. The natural area surveys in the Feather River are not currently capable of separating the spring and fall runs.

Historical spawner escapements for Sacramento River winter and spring Chinook salmon are presented in Appendix B, Table B-3.

## San Joaquin River Fall Chinook

San Joaquin River spawning areas are used primarily by fall Chinook. The estimated San Joaquin River fall Chinook spawning escapement in 2009 totaled 2,082 jacks and adults in natural areas and 1,802 jacks and adults to hatcheries (Appendix B, Tables B-1 and B-2 provide historical spawner escapements). Salmon production in the San Joaquin River is determined largely by spring outflows three years earlier. Since 1986, spawner returns to the San Joaquin River have constituted less than 10 percent of the total Central Valley escapement for fall run Chinook.

## NORTHERN CALIFORNIA COAST CHINOOK STOCKS

Northern California stocks include fall and spring stocks north of the entrance to San Francisco Bay. Primary river systems in this area are (from north to south) the Smith, Klamath, Mad, Eel, Mattole, and Russian rivers. Coastal Chinook stocks south of the Klamath River were listed as threatened under the ESA in September 1999.

## Management Objectives

In 2009, concern over the abundance of SRFC led to very limited ocean fisheries affecting northern California Chinook salmon stocks. KRFC were managed in accordance with 2009 Council guidance calling for a maximum adult natural spawner reduction rate of 67 percent, with a minimum spawner escapement of 40,700 adults in natural areas. The 2008 and 2009 minimum spawner escapement was raised from 35,000 to 40,700 in response to the triggering of an Overfishing Concern after failing to meet the 35,000 spawner escapement floor for three consecutive years (2004, 2005, and 2006). The available harvest of KRFC was shared equally between non-tribal and tribal fisheries (tribes with Federallyrecognized fishing rights). KRFC also provided the basis for the NMFS ESA consultation standard for California coastal Chinook, which limits the ocean harvest rate on age-4 KRFC to no more than 16.0 percent.

## Regulations to Achieve Objectives

To achieve the management objectives for KRFC, the adopted regulations were designed to result in: (1) a Klamath River run of 130,200 fall Chinook adults resulting in a spawner escapement of 40,700 fish in natural areas, taking into account projected river fishery impacts of 65,000 adults and returns to basin hatcheries; (2) 50 percent $(30,900)$ of the allowable adult harvest for tribal subsistence and commercial fisheries; (3) 99.6 percent $(30,800)$ of the non-tribal harvest to the Klamath River recreational fishery; and (4) 100 percent (approximately 100 fish) of the ocean harvest to the KMZ recreational fishery. The age- 4 ocean harvest rate resulting from the above configuration was expected to be less than one tenth of one percent.

## Inside Harvest

Yurok and Hoopa tribes shared a federally reserved right of 50 percent $(30,900)$ of the available harvest surplus of adult Klamath fall Chinook. The State of California managed the river recreational fishery under a 30,800 adult fall Chinook quota. Tribal adult fall Chinook landings totaled 28,387, which was 92 percent of the quota (Appendix B, Table B-5). The estimated recreational fishery harvest was 5,575 adult fish, which was 18 percent of the quota. Harvest estimates from streams outside the Klamath River Basin were not available.

## Escapement and Management Performance

## Threatened California North Coast Chinook

Historical indices of spawner abundance, or actual spawning escapement estimates, for Chinook salmon in California coastal streams outside of the Klamath River Basin are limited. Cursory, nonsystematic surveys are conducted on one tributary of the Mad River and two tributaries of the Eel River. Video counts of Chinook passage at Mirabel Dam on the Russian River have been conducted since 2000 (Appendix B, Table B-7).

The 2009 preseason forecast of the KRFC age-4 ocean harvest rate was less than one tenth of one percent (the ESA consultation standard for California Coastal Chinook was no more than 16.0 percent). The postseason evaluation of the 2009 KRFC age-4 ocean harvest rate was not available in time for this report.

## Klamath River Fall Chinook

The 2009 preliminary postseason river run size estimate for KRFC was 100,747 adults compared to the preseason predicted ocean escapement (river run size) of 130,200 adults. The escapement to natural spawning areas was 44,589 adults, which was 1.1 times the preseason prediction of 40,700 adults. The estimated number of hatchery returns was 19,614 adults. Table II-2, Figure II-2, and Appendix B, Table B-4 present historical harvest and escapement data for KRFC.

Spawning escapement to the upper Klamath River tributaries (Salmon, Scott, and Shasta Rivers), where spawning was only minimally affected by hatchery strays, totaled 10,516 adults. The Shasta River has historically been the most important Chinook salmon spawning stream in the upper Klamath River, supporting a spawning escapement of 30,700 adults as recently as 1964 , and 63,700 in 1935 . The escapement in 2009 to the Shasta River was 6,145 adults, while escapement to the Salmon and Scott Rivers was 2,204 and 2,167 adults, respectively (Appendix B, Table B-6).

## OREGON COAST CHINOOK STOCKS

Oregon coast Chinook stocks include all fall and spring stocks from Oregon streams south of the Columbia River. These stocks are categorized into two major subgroups based on ocean migration patterns. Although ocean harvest distributions overlap somewhat, they are categorized as either north or south/local migrating. North migrating Chinook stocks include stocks north of and including the Elk River, with the exception of Umpqua River spring Chinook. South/local migrating Chinook stocks include Rogue River spring and fall Chinook, Umpqua River spring Chinook, and fall Chinook from smaller rivers south of the Elk River.

Based on CWT analysis, the populations from ten major north Oregon coast (NOC) river systems from the Nehalem through the Siuslaw Rivers are harvested primarily in PSC ocean fisheries off B.C., SEAK and Oregon terminal area fisheries. NOC stocks are harvested to a much lesser degree, in Council area fisheries off Washington and Oregon. Analysis of CWTs indicates the populations from five major midOregon coast (MOC) systems between the Coos and the Elk Rivers are harvested primarily in ocean fisheries off B.C., Washington, Oregon and terminally. Minor catches occur in California fisheries and variable catches in SEAK troll fisheries. South/local stocks are important contributors to ocean fisheries off Oregon and northern California. Another central Oregon stock, Umpqua River spring Chinook, contributes primarily to ocean fisheries off Oregon and California, and to a lesser degree, off Washington, B.C., and SEAK.

## Management Objectives

The conservation objective for Oregon coast salmon was an aggregate of 150,000 to 200,000 natural adult spawners, as indicated by peak spawner counts of 60 to 90 fish per mile in standard index surveys. This stock has been an abundant stock historically, therefore preseason abundance estimates were not developed for this stock, and it has not been of critical management concern. ESA consultation standards for OCN coho, LCN coho, and California Coastal Chinook, and KRFC management objectives generally result in reduced Council-area ocean fishery impacts on Oregon south/local migrating Chinook stocks. Because of the depressed status of SRFC, Council-area Chinook fisheries were closed south of Cape Falcon in 2008, and only a 10 day recreational season was permitted in the KMZ in 2009. Humbug Mountain to Cape Falcon Chinook fisheries have minor impacts on most of the stocks originating from the NOC, which have a northerly marine distribution pattern.

## Regulations to Achieve Objectives

The areas of primary management concern for ocean fisheries impacting Oregon coast Chinook vary between the north and south/local migrating stocks, although there is some overlap. Preseason abundance estimates were not available for Oregon coast Chinook; however, based on postseason abundance
indicators, Council area fisheries impacts on this stock have not significantly affected objective achievement in recent years. Under the 2009 regulations, the STT was uncertain that the aggregate conservation objective for this stock would be met; however, because of the constraints required for SRFC, LCN and OCN coho, Council-area fisheries were not expected to affect compliance.

For the 2009 Oregon State-waters terminal area fisheries, conservative regulations were adopted with the intention of reducing impacts on these stocks. These regulations included season quotas, daily and weekly landing limits in commercial fisheries, and reduced daily and season bag limits and partial markselective restrictions in recreational fisheries.

## Inside Harvest

Inside recreational harvest of fall and spring Chinook occurred in most Oregon coastal estuaries and rivers. Complete estimates of the 2009 recreational Chinook harvest in freshwater areas were not available. Historical estimates of the recreational harvest of fall and spring Chinook, derived from Oregon Department of Fish and Wildlife (ODFW) salmon and steelhead angler catch record cards are reported in Table II-3.

## Escapement and Management Performance

Actual escapement was not estimated for this stock aggregate. Achievement of an aggregate 150,000 to 200,000 naturally spawning adults was assessed through indices (e.g., stream surveys, dam counts, etc.). The escapement goal was equivalent to peak spawner index counts of 60 to 90 adults per mile in nine index streams and included both spring and fall Chinook. Peak spawner index counts were based on traditional non-random surveys. ODFW is developing alternate methodologies for establishing escapement goals for Oregon coastal Chinook stocks, including fall Chinook PSC indicator stocks. Upon completion of this process, the escapement goals and assessments for these stocks will likely change.

The overall quota for the two terminal area commercial fisheries was 600 Chinook. The catch estimate for those fisheries was 433 Chinook.

## North Migrating Chinook

An index of adult spawners (peak count per index mile) in nine standard streams was used to measure natural spawner escapement trends for north migrating fall Chinook. Data have been collected since about 1950 for most systems. Overall peak Chinook adult index spawner counts in 2009 were preliminarily estimated at 61 adults per mile, within the goal range of 60 to 90 adults per mile (Table II-4, Figure II-3).

## South/Local Migrating Chinook

Standard fall Chinook spawning index escapement data for the smaller southern Oregon coastal rivers (south of the Elk River) were available for the Winchuck, Chetco, and Pistol Rivers (Appendix B, Table B-8). Rogue River carcass counts were used as an indicator of trends in escapement for naturally produced fall Chinook, but these surveys have not been conducted since 2004 (Table II-4). Therefore, two trend indicators of escapement for naturally produced spring Chinook were utilized: (1) Rogue River counts at Gold Ray Dam, and (2) Umpqua River counts at Winchester Dam (Table II-4). Escapement based on these indicators had been declining since 2003, although the 2009 returns were an increase over the previous two years (Figures II-3 and II-4). The aggregate Oregon coast goal of 150,000 to 200,000 naturally spawning Chinook adults was probably met in 2009.

## COLUMBIA RIVER BASIN CHINOOK STOCKS

Columbia River Basin Chinook salmon stocks include fall, summer, and spring stocks. NMFS has listed five Chinook ESUs within the Columbia Basin under the ESA, (1) Snake River wild (SRW) fall Chinook listed as threatened April 1992; (2) Snake River spring/summer listed as threatened April 1992; (3) upper Columbia River spring listed as endangered March 1999; (4) lower Columbia River listed as threatened March 1999; and (5) upper Willamette River spring listed as threatened March 1999.

The assessment below covers five major stock groups of Columbia River Basin fall Chinook: lower river hatchery (LRH) tule stock and lower river wild (LRW) bright stock, both of which are part of the ESAlisted lower Columbia River Chinook ESU; Spring Creek Hatchery (SCH) tule stock; upriver bright (URB) stock, which includes the ESA-listed Snake River fall Chinook ESU; and mid-Columbia bright (MCB) hatchery stock. Management details for Columbia River spring and summer Chinook stocks are not discussed, since Council-managed ocean salmon fisheries have very limited impacts on these stocks (less than a 2 percent exploitation rate in base-period fisheries). Appendix B, Tables B-12 through B-19, contain historical harvest and escapement data for fall, summer, and spring stocks. Appendix B, Table B20 summarizes catch information for all three Chinook runs in the Columbia Basin. Additional information on these stocks can be found in the Joint Staff Report: stock status and fisheries for spring Chinook, summer Chinook, sockeye, steelhead, and other species and miscellaneous regulations and the Joint Staff Report concerning the fall in-river commercial harvest of Columbia River fall Chinook, summer steelhead, coho salmon, chum salmon, and sturgeon published annually by the joint staffs of ODFW and WDFW.

## Management Objectives

Council-area fisheries north of Cape Falcon in 2009 were managed to access SCH and LRH stocks while meeting the NMFS ESA consultation standards for the ESA-listed SRW fall Chinook ESU and lower Columbia River Chinook ESU (both LCR natural tules and LRW). The standard for the SRW ESU was no less than a 30.0 percent reduction in the Snake River Fall Index (SRFI) from the 1988 through 1993 base period exploitation rate for all ocean fisheries combined. The standard for ESA-listed lower Columbia River natural tules was a total (ocean plus inriver) AEQ exploitation rate of no more than 38.0 percent. For preseason modeling, the estimated total exploitation rate on a composite of Washougal, Kalama, Cowlitz, and Big Creek hatchery tules was used as a surrogate for natural tules. The NMFS ESA consultation standard for LRW is a North Lewis River fall Chinook spawning escapement of 5,700; the preseason forecast was for an escapement of 8,600 . In 2009, the NMFS ESA consultation standard for the threatened LCR tule Chinook was the primary constraint on Council-area Chinook fisheries north of Cape Falcon.

## Inside Harvest

Since the Columbia River Fishery Management Plan expired on December 31, 1998, fall Chinook in Columbia River fisheries were managed through 2007 under the guidance of annual management agreements among the U.S. versus Oregon parties. In 2008, a new 10 year management agreement was negotiated through the U.S. versus Oregon process, which included revisions to some inriver objectives. In particular, the "2008-2017 U.S. v Oregon Management Agreement" (2008-2017 MA) specified that with run sizes of at least 200,000 URB, including at least 6,000 SRW fall Chinook, the allowable URB impact rate would be 38 percent. NMFS used the URB impact rate as a proxy in the SRW consultation standard.

In 2009, the fall fisheries were managed to achieve the NMFS ESA consultation standards for the threatened SRW and LCR tule Chinook.

Harvestable surplus was projected for all major fall stocks in 2009. The postseason fall Chinook run reconstruction, however, was not completed in time for this report. The preliminary catch estimate for the non-Indian commercial gillnet fisheries were 33,450 fall Chinook in mainstem fisheries and 8,000 fall Chinook in Select Area (terminal) fisheries. The preliminary catch estimates for the treaty Indian fisheries were 75,100 adult fall Chinook. The preliminary catch estimate for the recreational fisheries included 5,940 fall Chinook in the Buoy 10 fishery, and 12,800 fall Chinook in mainstem fisheries below Bonneville Dam, and 6,560 fall Chinook in the Hanford Reach fishery above McNary Dam (Appendix B, Table B-20).

## Escapement and Management Performance

All Columbia River fall stocks except LRW met their escapement objectives (Table II-5, Appendix B, Tables B-15 to B19). The LRW escapement objective was 5,700 adult spawners in the North Fork Lewis River; however, the preliminary escapement estimate was 5,400 . Preliminary estimates of total return to the river were: 75,000 LRH; 7,800 LRW; 59,400 SCH; 194,800 URB; and 93,500 MCB. The total return to the river mouth of the five stocks was 430,500 fall Chinook (Figure II-5).

The 2009 URB and SRW run sizes were both large enough to allow a 38 percent harvest rate per the 2008-2017 MA. The preliminary URB harvest rate estimate was 28.5 percent. No specific escapement goal was established for the ESA-threatened SRW. Because nearly all spawning of this stock occurs upstream from Lower Granite Dam, establishing a spawning escapement goal at Lower Granite Dam would be appropriate. In the Proposed Recovery Plan for Snake River Salmon, NMFS has proposed a delisting goal for SRW that provides for an eight-year (approximately two generation) geometric mean of at least 2,500 natural origin spawners in the mainstem Snake River annually; the eight-year mean through 2008 was 2,786 . The total adult fall Chinook count at Lower Granite Dam in 2009 was 15,167 down from 16,628 in 2008. A significant portion of recent years returns were from supplementation programs. An estimate of SRW fall Chinook spawning escapement in 2009 was not available for this report.

No postseason estimates of exploitation rate on Columbia River natural tule or SRW for ocean fisheries were available.

## WASHINGTON COASTAL CHINOOK STOCKS

Washington coastal Chinook stocks include all fall, summer, and spring stocks from coastal streams north of the Columbia River through the western Strait of Juan de Fuca (west of the Elwha River, inclusive). This complex consists of several natural stocks, generally of small to medium-sized populations, and some hatchery production (primarily Willapa Bay and Quinault River). Fall stocks are impacted primarily in B.C and SEAK fisheries, while spring stocks are not significantly impacted in any ocean fisheries. Neither spring nor fall coastal stocks are impacted significantly by Council-area ocean fisheries.

## Management Objectives

Willapa Bay natural fall Chinook do not have a conservation objective defined in the Salmon FMP, although WDFW has a spawning escapement objective of 4,350 natural Chinook, which is based on peak density estimates and watershed area.

Spawning escapement goals for natural stocks managed within this complex north of Willapa Bay, established in U.S. District Court by WDFW and the treaty Indian tribes, were recognized in the Council's FMP conservation objectives. Objectives for Grays Harbor and the North Coast river systems were established pursuant to the U.S. District Court order in Hoh versus Baldrige. However, annual natural spawning escapement targets may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of Hoh versus Baldrige and subsequent U.S. District Court
orders. After agreement is reached on the annual targets, ocean fishery escapement objectives are established for each river, or region of origin, which include provisions for treaty Indian allocation and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal Chinook other than those in the FMP were made in 2009.

Washington coastal Chinook stocks have base period Council-area ocean fishery AEQ exploitation rates of 5 percent or less which are below a management threshold for effective Council management of these stocks, and therefore qualify as exceptions to the Council's overfishing criteria.

## Regulations to Achieve Objectives

Preseason abundance forecasts for some Washington coastal Chinook stocks were available for the first time in 2008 for the Council preseason management process. However, base period Council area ocean fishery AEQ exploitation rates of 5 percent or less for these stocks were below a management threshold that allows effective Council management of these stocks, and therefore they qualified as exceptions to the Council's overfishing criteria.

## Willapa Bay Chinook

## Inside Harvest

Run size, harvest, and escapement data for Willapa Bay fall Chinook are presented in Appendix B, Table B-23.

No Chinook-directed non-Indian gillnet fishery was conducted during July and the first half of August 2009. This fishery is commonly referred to as the "summer dip-in" fishery; it occurs irregularly because historically it was dependent on Columbia River tule abundance, which are now an ESA listed stock. This fishery was generally assumed to harvest Columbia River tule stocks in a mix similar to adjacent ocean area catches; however, in light of recent catch composition information (>70 percent local Willapa Bay and Grays Harbor origin stock) this assumption has been questioned.

The 2009 pre-season forecast of Chinook returning to Willapa Bay was 36,768 fish (1,951 natural and 34,817 hatchery). Because the forecast was below the WDFW conservation objective, inside fisheries were managed for an impact rate of no more than 30 percent ( 583 natural Chinook). Consequently, the one-day update fishery that typically occurs in late August was eliminated in order to maximize harvest of hatchery coho. Chinook harvest in coho-targeted gillnet fisheries during 2009 totaled 6,868 fish (618 natural) based on preliminary data.

Recreational fisheries in the marine waters of Willapa Bay were open from June 28 through July 31, 2009 concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1 through August 15, 2009, Willapa Bay was open to recreational fishing with no more than two adults allowed to be harvested daily. Barbed hooks were allowed when fishing for salmon and retention of chum salmon was allowed. Regulations changed for the period between August 16, 2009 through January 31, 2010 to allow harvest of no more than three adults daily, only two of which could be Chinook. Barbed hooks were allowed when fishing for salmon and retention of chum salmon was not allowed.

Recreational salmon fisheries in tributaries to Willapa Bay varied in duration but were generally open from August 1, 2008 through January 31, 2010 with two adult Chinook allowed daily. Single-point, barbless hooks were required in all areas. Recreational harvest estimates were not available for 2009.

## Escapement and Management Performance

During 2008, Chinook returning to hatcheries in the Willapa Bay watershed totaled 15,241 fish. Based on current hatchery production, this return was sufficient to achieve the goal of 9,800 total Chinook escapement to Willapa Bay hatchery facilities. An escapement estimate was unavailable for 2009.

The WDFW escapement goal for naturally spawning Chinook in Willapa Bay was 4,350 adults. An estimate of the 2009 natural spawning escapement was not available (the 2008 natural escapement was 1,542 Chinook). An estimated 976 natural Chinook were harvested in commercial and recreational fisheries in 2009, above the preseason expectation of 583.

## Grays Harbor Chinook

## Inside Harvest

Run size, harvest, and escapement data for Grays Harbor Chinook are presented in Appendix B, Table B25.

Spring Chinook sales were prohibited in the Chehalis Tribe commercial gillnet fishery, but the Tribe reported some ceremonial and subsistence permit fishing during the season. On the Chehalis River and the Humptulips commercial fishing Area 2C, the Quinault Indian Nation conducted a spring/summer commercial gillnet fishery with mesh restrictions to reduce impacts on spring Chinook while targeting white sturgeon. The recreational season was also closed to spring Chinook retention in Grays Harbor. No summer non-Indian gillnet fishery directed at non-local Chinook stocks occurred in 2009.

The non-Indian gillnet fishery in Humptulips commercial Area 2-C allowed retention of fall Chinook and marked coho. Live boxes were required and unmarked coho could not be retained. There was no nonIndian gillnet fishery scheduled in the Chehalis River in 2009. The recreational fishery in Marine Area 22 was open from September 16 through November 30, although Chinook retention was not allowed. The recreational fishery in the Chehalis River was closed to Chinook retention. In the recreational Humptulips River fishery from the mouth to Hwy 101 Bridge, retention of Chinook was allowed from September 16 through January 31. Recreational harvest estimates were not available.

The Quinault Indian Nation fall gillnet fishery harvested a total of 2,485 fall Chinook in two separately scheduled areas: the first in the lower Humptulips River and adjacent Area 2C of Grays Harbor and the second in the lower Chehalis River and adjacent areas of Grays Harbor, Areas 2D, 2A, and 2A-1. Fishing was restricted to east of Stearns Bluff in the Chehalis River, and Areas 2D, 2A, and 2A-1 to limit catches of Chinook destined to Grays Harbor tributaries other than the Chehalis River. The Humptulips area treaty Indian gillnet fishery caught 1,328 fall Chinook, which was just below the preseason expected catch level. The Chehalis River treaty Indian gillnet fishery caught 1,157 fall Chinook, which was half of the preseason expected catch level.

## Escapement and Management Performance

Chehalis River spring Chinook are of natural origin and managed for an escapement goal of 1,400 adults. The 2009 terminal run forecast for spring Chinook was 1,018 adult fish; an escapement estimate was not available for the 2009 return. The 2008 final escapement estimate was 995.

Grays Harbor fall Chinook were managed for a natural spawning escapement goal of 14,600 adults. The 2009 Grays Harbor fall Chinook forecast was 19,325 wild and 2,938 hatchery adults; the total spawning ground escapement estimate for 2008 was 15,331 , which included some hatchery origin fish. The established hatchery escapement goals for Grays Harbor are 400 for the Chehalis River, which was not
achieved in 2008 and 369 for the Humptulips River, which was achieved in 2008. Natural and hatchery escapement estimates for 2009 were not available.

## Quinault River Chinook

## Inside Harvest

Historical terminal gillnet harvest data for Quinault River Chinook stocks are presented in Appendix B, Table B-27.

A run of natural spawning spring/summer Chinook enters the river from April through July. The spring/summer Chinook run is typically small and any harvest is taken incidentally during fisheries directed at sockeye and steelhead. A total of approximately 40 spring/summer Chinook were harvested in 2009.

The 2009 harvest of Quinault River fall Chinook was mostly hatchery origin fish taken in September and October. The treaty Indian net catch totaled 5,455 fall Chinook.

## Escapement and Management Performance

Quinault fall Chinook were managed for hatchery production. The 2009 fall Chinook spawning escapement estimate was not available. Hatchery egg-take goals for fall Chinook were obtained at the tribal facilities. In addition, fall Chinook eggs to supplement hatchery rack returns at the U.S. Fish and Wildlife Service (USFWS) Quinault National Fish Hatchery were taken at the tribal facility with a number of Chinook also returning to the Federal hatchery, given strong flows in Cook Creek.

## Queets River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Queets River spring/summer and fall Chinook are presented in Appendix B-29 and B-30, respectively.

The treaty Indian gillnet harvest of spring/summer Chinook was limited. Fishing remained closed during the spring/summer period through to the last week of August. The non-Indian in-river recreational fishery was closed to retention of Chinook.

Fall Chinook were harvested from August 29 through October 29 by the treaty Indian gillnet fall fishery. The fishery followed a plan set by a preseason management agreement between the Quinault Indian Nation and WDFW to target hatchery and natural coho, but also allowed harvest of natural and indicator Chinook. The treaty Indian gillnet fishery harvested 1,522 fall Chinook in the commercial fishery. Recreational fisheries targeted coho and Chinook during standard schedules in the Queets and Clearwater Rivers. The on-reservation Salmon River recreational salmon harvest was limited to retention of coho. Only mark-selective Chinook retention was allowed within Olympic National Park waters. Catch estimates for recreational fisheries were not available.

## Escapement and Management Performance

The preliminary 2009 spawning escapement estimate for Queets River spring/summer Chinook was 495 adults, about 70 percent of the minimum escapement goal of 700 .

The fall Chinook spawner survey escapement estimate was not completed; however, total fall Chinook escapement in 2009 is expected to be above the minimum escapement goal of 2,500 . High flow conditions during Chinook spawning may adversely affect the quality of independent spawner survey
escapement estimates. Catch sampling suggests a higher proportion of the returns may have been natural fish than forecasted pre-season, with the remaining being "indicator" Chinook. The indicator Chinook originate from wild broodstock taken each year in the river.

## Hoh River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River spring/summer and fall Chinook are presented in Appendix B, Tables B-32 and B-33, respectively.

The 2009 Hoh River spring/summer Chinook terminal abundance forecast was 1,061 fish, allowing for a terminal harvest rate of 15 percent. The treaty gillnet fishery occurred between the weeks of May 4 and the week of July 6 , and was open two days per week during the first six weeks and one day per week for the remaining four weeks. Tribal regulation in 2009 required a minimum of 8 inch stretch mesh during the first four weeks in order to minimize incidental take of steelhead kelts. The treaty Indian gillnet fishery harvested 141 Chinook, including an estimated five taken during separately scheduled ceremonial and subsistence fishing. Results of mark sampling and scales indicated that 108 of these were of hatchery origin (33 natural). A mark-selective non-Indian recreational fishery operated downstream of Willoughby Creek from May 16 through August 31, Wednesdays through Sundays, with a bag limit of one marked adult per day. A preliminary estimate of Chinook taken in the sport fishery was not available.

Hoh River fisheries for fall Chinook were based on an expected terminal run size of 3,276 adults, allowing for a terminal harvest rate of 35.3 percent. The spawning escapement was expected to be 2,120 adults.

The tribal fishery targeted 23.96 percent of the terminal run. The treaty Indian gillnet fishery was scheduled for one day per week during the first week of September (Week 36), two days per week in Week 37, Week 39 through week 41 and Week 46 to Week 3 (2010), and three days per week in Week 38 and Weeks 42 to Week 45. The tribal fishery caught approximately 534 Chinook. Results of mark sampling indicated that 523 of these were of natural origin; CWT data were not available.

The non-Indian recreational fishery extended from September 1 through November 30, with the river below Willoughby Creek open and a daily-bag-limit of six salmon, two of which could be adults. The portion of the river between Willoughby Creek and Morgan’s Crossing was open October 16 through November 30. The delayed opening was to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan's Crossing was closed to recreational salmon fishing. A preliminary estimate of Chinook taken in the sport fishery was not available.

## Escapement and Management Performance

Tribal catch and expected harvest rates indicate the spring/summer Chinook terminal run size was lower than preseason expectations. The preliminary 2009 spawning escapement for Hoh River spring/summer Chinook was estimated at 880 adults, approximately 20 fish lower than the 900 fish escapement floor established for this stock.

Tribal catch and expected harvest rates indicated the fall Chinook terminal run size was slightly below the level anticipated preseason. A preliminary 2009 spawning escapement for Hoh River fall Chinook was estimated at 1,494 , which was 76 percent of the forecast escapement of 1,966 . The escapement goal was 1,200 , and terminal fisheries targeted a harvest rate of approximately 40 percent.

## Quillayute River Chinook

## Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River spring, summer, and fall Chinook are presented in Appendix B, Tables B-35 and B-36 respectively. Spring and summer Chinook are currently managed separately, but data for both are combined in Table B-35. All hatchery origin fish are considered to be spring Chinook, and all natural spawners and tribal broodstock collections are considered to be summer Chinook. The management of these stocks is currently under review by the WDFW and Quileute Tribal co-managers.

The recreational and tribal fisheries for spring and summer Chinook were established by a preseason management agreement between WDFW and the Quileute Tribe. The total tribal catch for 2009 was 380 spring and 126 summer Chinook and included ceremonial and subsistence use. Estimates of 2009 recreational spring and summer Chinook harvest were not available.

The total 2009 Quileute Tribal harvest of fall Chinook was 2,434, and included ceremonial and subsistence use. An estimate of the 2009 recreational catch was not available.

As in past years, WDFW required release of unmarked Chinook during July and August to reduce impacts of the recreational fishery on the natural summer Chinook stock. The fall recreational fishery from September through November proceeded with normal bag limits and schedule. The Quileute Tribe did not have a closure in their fishery this year, but as in past years, reduced their fishery to 29 hours per week during July and August to reduce impacts to summer Chinook.

## Escapement and Management Performance

The management agreement called for an escapement goal of 200 hatchery spring Chinook. The actual rack return was 722 , which exceeded hatchery requirements.

The summer Chinook run was managed to achieve an escapement of 1,200 adults, jacks, and broodstock collection combined. The preliminary estimated natural spawning summer Chinook escapement of 895 was under the escapement goal.

Terminal area fisheries on fall Chinook were managed for a target 40 percent harvest rate, with a minimum escapement level of 3,000 adults. The preliminary escapement estimate of 3,083 fall Chinook was above the escapement goal.

## PUGET SOUND CHINOOK STOCKS

Puget Sound Chinook stocks include all fall, summer, and spring stocks originating from U.S. tributaries in Puget Sound and the eastern Strait of Juan de Fuca (east of Salt Creek, inclusive). This stock complex consists of numerous natural Chinook stocks of small to medium sized populations and significant hatchery production. The Puget Sound ESU was listed under the ESA as threatened in March 1999.

## Management Objectives

The stocks within this complex and their respective FMP conservation objectives were established in U.S. District Court by WDFW and the treaty Indian tribes. The conservation objectives for stocks managed primarily for natural production were developed by a State/Tribal Management Plan Development Team following the Boldt Decision, and were based on "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The objectives were estimated for the average spawning escapement during periods thought to represent spawner abundances that provided maximum production. The objectives for
stocks managed for artificial production are based on hatchery escapement needs. Annual management targets (expected hatchery returns plus natural escapement) for specific rivers or regions of origin may vary from the FMP conservation objectives by following fixed procedures established in U.S. District Court as outlined in "Memorandum Adopting Salmon Management Plan" (U.S. versus Washington, 626 F. Supp. 1405 [1985]).

In 2009 Puget Sound stocks were managed pursuant to the provisions of a WDFW/Tribal management plan approved under a 4(d) rule promulgated by NMFS. This plan contains exploitation rate ceilings for ESA-listed Puget Sound stocks that were compared to predicted exploitation rates to assess compliance with ESA consultation standards (Table II-5).

## Regulations to Achieve Objectives

Puget Sound stocks contribute to fisheries off B.C., are present to a lesser degree off SEAK, and are impacted to a minor degree by Council-area ocean fisheries. Puget Sound stocks have base period Council-area ocean fishery AEQ exploitation rates of 5 percent or less which are below a management threshold for effective Council management of these stocks, and therefore qualify as exceptions to the Council's overfishing criteria.

## Inside Harvest

Commercial inside fishery harvest of Puget Sound Chinook was managed on the basis of six regional stock management units or, in some cases, component stocks within management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest was regulated according to the natural spawning escapement goal or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) is presented in Appendix B, Table B-38. These catches included some fish of non-Puget Sound origin. The total commercial harvest in Puget Sound in 2009 was 77,052 Chinook, compared to 105,163 Chinook caught in 2008. The 2009 non-Indian net catch was 2,749 Chinook, compared to 6,103 Chinook caught in 2008. The 2009 treaty Indian net and troll harvest was 74,303 Chinook, compared to 103,567 Chinook caught in 2008.

Chinook catches in the Puget Sound recreational fishery for years 1971 through 2008 are presented in Appendix B, Table B-39. Catch estimates for the 2009 Puget Sound recreational fishery were not available.

## Escapement and Management Performance

Puget Sound Chinook management goals for fishery planning processes in 2009 were expressed in terms of constraints on total fishery rebuilding exploitation rates (RER) or on exploitation rates on fisheries south of the Canadian border for those stocks without RERs. Information to evaluate performance against these constraints was not available.

Historical hatchery and natural run component escapements and net catches for summer/fall Chinook for each Puget Sound region of origin are presented in Appendix B, Table B-40. Historical spring Chinook escapement data are presented in Appendix B, Table B-43.

All but one Puget Sound spring Chinook hatchery escapement goals were met (93 percent at Kendall Creek). Preliminary data suggest most Puget Sound hatcheries met their summer/fall Chinook goals.

Naturally spawning Puget Sound spring and summer/fall Chinook remained depressed in 2009. Preliminary data suggest no Puget Sound spring Chinook natural stocks met their escapement goals. Preliminary information on 2009 natural spawning escapements for summer/fall Chinook stocks indicate
escapement goals were met in some areas, but not in many others. Escapement estimates for 2009 were not available for most runs. In many natural spawning areas, hatchery Chinook comprise a large component of the natural spawning population.

## COASTWIDE GOAL ASSESSMENT SUMMARY

Information to assess conservation objectives was unavailable for LCR natural tule Chinook, SRW fall Chinook, Grays Harbor natural fall Chinook, and all Puget Sound natural Chinook stocks. Conservation objectives for all other Council managed Chinook stocks were met except for natural and hatchery spawning adult escapement for SRFC, Hoh spring/summer, Queets spring/summer, and Quillayute summer Chinook.

A summary of 2009 performance for Chinook salmon stocks in relation to Council conservation objectives is presented in Table II-5.

a/ North migrating peak counts are taken on nine miles of standard index surveys over nine river systems (see Appendix B, Table B-11 for individual system counts). Complete carcass counts are listed in Appendix B, Table B-10. Complete counts for Gold Ray and Winchester dams are listed in Appendix B, Table B-9.
b/ In 2004 one of the standard survey sections was not sampled. In the previous two years this section accounted for $33 \%$ of the total adult carcass counts.
c/ Preliminary.
d/ Surveys were not conducted.

| System and Stock | 2009 Conservation Objective(s) | Achievement |
| :---: | :---: | :---: |
| Sacramento River Chinook |  |  |
| Fall | 122,000-180,000 natural and hatchery adults. | Preliminary estimate of 39,530 natural and hatchery adult fall Chinook, 32\% of the lower end of the escapement goal range. |
| Winter (Endangered) | NMFS ESA consultation standard defines specific limits on management measures to protect Sacramento River winter and spring Chinook. | Commercial and recreational seasons south of Point Arena conformed with the consultation standard. |
| Spring (Threatened) | Same objective as for winter Chinook. | Objective met-see winter Chinook achievement. |
| California North Coast Chinook |  |  |
| Klamath River Fall | Minimum escapement of 40,700 natural adult spawners. | 44,589 natural area spawners, 127\% of FMP conservation objective; $110 \%$ of annual management objective. |
| California Coastal (Threatened) | No greater than $16.0 \%$ ocean harvest rate on age-4 Klamath River fall Chinook. | Preseason projection of <0.1\%; no postseason estimate is currently available. |
| Oregon Coast Chinook |  |  |
| North and South/Local Migrating Stocks | 150,000-200,000 natural adult spawners (equivalent to peak spawner index counts of 60-90 adults per mile). | 61 natural adult spawners per mile, above the lower bound of the aggregate stock index range. |
| Columbia River Basin Fall Chinook |  |  |
| LRW (Component of threatened lower Columbia River Chinook ESU) | MSY objective of 5,700 natural North Lewis River adult spawners (no specific NMFS ESA guidance for 2009). | Preliminary estimate of 5,400 is $95 \%$ of the conservation objective. |
| Lower Columbia natural tules (Component of threatened Iower Columbia River Chinook ESU) | Total (ocean plus inriver) AEQ exploitation rate on ESA-listed natural tules of no more than 38.0\%. | Preseason projection of $38.0 \%$. No postseason estimate is currently available. |
| LRH | 14,100 adult hatchery spawners. | Preliminary projection of 28,056 adult hatchery spawners, $199 \%$ of goal. |
| SCH | 7,000 adult hatchery spawners. | 13,700 adult hatchery spawners, 196\% of target. |
| MCB | No FMP objective; target of 7,750 hatchery adults. | 21,470 adult hatchery spawners, $277 \%$ of target. |
| URB | 40-45,000 natural and hatchery adults above McNary Dam, plus meet treaty Indian obligations. U.S. v. Oregon parties agreed to 60,000 in 2009. | 104,684 natural and hatchery adults over McNary Dam, 232\% of MSY target in FMP. |

TABLE II-5. Performance of Chinook salmon stocks in relation to 2009 conservation objectives (preliminary data).
(Page 2 of 2)

| System and Stock | 2009 Conservation Objective(s) |  |  | Achievement |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Columbia River Basin Fall Chinook (continued) |  |  |  |  |  |  |
| Snake River Fall Chinook (Threatened; component of URB) | SRFI $\leq 0.700$ for all ocean fisheries combined (i.e., no less than a $30.0 \%$ reduction from the 1988-1993 base period exploitation rate). |  |  | Preseason SRFI projection of 0.473 . No postseason estimate is currently available. |  |  |
| Washington Coastal Chinook |  |  |  |  |  |  |
| Fall | Natural spawner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations. |  |  | Based on preliminary estimates, Quilayute natural, and Hoh River natural objectives were met. Other estimates are not yet available. |  |  |
| Spring/Summer | Natural spawner escapement objectives as provided in state-tribal agreements; meet hatchery egg-take goals and meet treaty Indian obligations. |  |  | Based on preliminary estimates, objectives were not met for Hoh and Queets spring/summer natural, and Quillayute summer natural. An estimate is not available for Grays Harbor spring Chinook. |  |  |
| Puget Sound Chinook |  |  |  |  |  |  |
| (Threatened) | Minor part of Washington ocean harvest; Council ocean management not directed at these stocks. Adult equivalent exploitation rate standard developed for some stocks: |  |  | Postseason estimates not available. ## CHAPTER III

## COHO SALMON MANAGEMENT

## OREGON PRODUCTION INDEX AREA COHO STOCKS

Oregon Production Index (OPI) area coho stocks include all Washington, Oregon, and California natural and hatchery stocks from streams south of Leadbetter Point, Washington, although stocks produced north of Leadbetter Point are also intercepted in the OPI area. The largest naturally produced coho stock is OCN coho, which includes coho produced from Oregon river and lake systems south of the Columbia River. OCN coho are managed as a stock aggregate with four identified components. NMFS listed three coho ESUs within the OPI area as threatened: CCC coho listed October 1996, SONCC coho listed May 1997, and OCN coho listed August 1998. In 2002, NMFS began an update of all its listing determinations and in January of 2006 concluded that the OCN ESU did not warrant listing under the ESA. That determination was overruled by a U.S. Court decision in 2007, and subsequently relisted by NMFS as threatened in February 2008. Columbia River natural coho were listed as endangered under the Oregon State ESA in 2002, and as threatened under the Federal ESA on June 28, 2005. The primary OPI hatchery stocks include a south migrating Columbia River (early) stock, a north migrating Columbia River (late) stock, public hatchery coho from the Oregon and northern California Coast, and formerly a small cooperative program along the southern Oregon Coast known as the Salmon Trout Enhancement Program (STEP), which was discontinued after the 2004 brood releases.

## Management Objectives

In establishing ocean salmon fisheries that impact OPI area coho stocks, the Council was guided by the reasonable and prudent alternatives of NMFS 1999 Supplemental Biological Opinion and Incidental Take Statement for CCC and SONCC coho and the February 2009 NMFS ESA guidance letter for LCN natural and OCN coho, which required:

1. No directed coho fisheries or retention of coho in all commercial and recreational fisheries off California to protect endangered CCC coho.
2. Marine fishery impacts on endangered CCC and threatened SONCC coho must be no more than 13.0 percent as indicated by projected impacts on RK hatchery coho.
3. Fishery impacts on threatened LCN coho must not exceed a coastwide marine and mainstem Columbia River exploitation rate of 20.0 percent.
4. Fishery impacts on threatened OCN coho must not exceed a coastwide marine and freshwater exploitation rate of 15.0 percent.

Based on parent escapement levels and observed OPI smolt-to-jack survival for 2006 brood OPI smolts, the total allowable OCN coho exploitation rate for 2009 fisheries was no greater than 15.0 percent under the Salmon FMP (Amendment 13) and no greater than 15.0 percent under the matrix developed by the OCN work group during their review of Amendment 13. The work group recommendation was accepted by the Council as expert biological advice in November 2000.

The Council was also guided by a treaty Indian/non-Indian sharing agreement for Columbia upriver coho stocks, which required passage of 50 percent of the run destined for areas above Bonneville Dam.

## Regulations to Achieve Objectives

Historically, OPI area coho stocks contributed primarily to ocean fisheries off Oregon and northern California and, to a lesser degree, Washington and B.C. The Council prohibited retention of coho in all fisheries south of the Oregon/California border, and adopted seasons the STT projected would result in exploitation rates of 2.8 percent for RK coho in marine fisheries, 13.0 percent for OCN coho in marine and freshwater fisheries combined, and 12.5 percent for LCN coho in marine fisheries.

## Commercial Troll

Commercial troll fisheries had been closed to coho retention south of Cape Falcon since 1993 with the exception of a limited fishery in 2007 and 2009. In 2009, from Cape Falcon to Humbug Mtn. the commercial coho fishery had an overall quota of 21,240 ( 11,000 preseason plus transfer of additional coho from the recreational fishery quota on an impact neutral, fishery equivalent basis). The fishery was not restricted to mark-selective coho retention. Chinook fishery closures and gear restrictions (fourspread requirement) were also used to reduce coho impacts.

Non-Indian commercial troll fisheries from Cape Falcon to the U.S./Canada border in 2009 had an overall quota of 33,600 coho, (Table I-1). The fisheries were restricted to mark-selective coho retention.

All species treaty Indian fisheries north of Cape Falcon were not restricted to mark-selective retention of coho, and operated on an overall quota of 60,000 coho (Table I-2).

## Recreational

Retention of coho has been limited in the recreational fisheries south of Cape Falcon since 1993. Retention of coho has been prohibited off California since 1996 to protect ESA listed CCC coho. All coho directed ocean recreational fisheries in the OPI area have been mark-selective since 1998. Adequate abundance of marked coho in the OPI area has resulted in allowable harvests of marked coho in Oregon and Washington within constraints for OCN and LCN coho.

In 2009, after inseason adjustments, the recreational coho fisheries north of Cape Falcon operated with quotas of 16,100 in the Neah Bay area, 8,080 in the La Push area, 55,270 in the Westport area, and 96,500 in the Columbia River area (Table I-3). The recreational fishery between Cape Falcon and the OR/CA border operated with an overall quota of 110,000 June 20 through August 31. Less than 70,000 coho were harvested, so 40,000 coho remaining on the quota were transferred to the September Cape Falcon to Humbug Mt. recreational and commercial fisheries on an impact neutral, fishery equivalent basis. These inseason adjustments resulted in transfers of 10,240 coho to the September commercial fishery, increasing the quota form 11,000 preseason to 21,240 (Table I-1) and 2,560 coho to the September recreational fishery, increasing the quota from 7,000 preseason to 9,560 (Table I-3).

## Inside Harvest

Coho retention in all California fisheries was prohibited.
The 2009 inside recreational harvest of coho in Oregon coastal streams, as in recent years, was very restricted and generally limited to areas where surplus hatchery coho returns were expected. Estimates of the 2009 inriver recreational coho harvest for most areas were not available. Historical estimates of the recreational harvest of adult coho in Oregon coastal estuaries and rivers, derived from ODFW salmon and steelhead angler catch record cards, are reported in Table III-1.

Limited recreational fisheries for naturally-produced coho were approved in the Nehalem, Yaquina, Coos and Coquille estuaries in 2009. The catch estimates were 959, 535, 1,145, and 962 respectively.

A limited fishery for naturally-produced coho was approved in Siltcoos and Tahkenitch Lakes. The recreational fishery opened October 1 and closed December 31 as scheduled. The final catch estimates were similar to the previous 3 -year average of 310 adults. The 2009 catch estimates were 265 adults in the Siltcoos Lake fishery and 80 adults in the Tahkenitch Lake fishery.

The 2009 Columbia River non-Indian commercial gillnet fishery harvested 125,400 adult coho, compared to 60,400 coho in 2008. Select Area fisheries in both Oregon and Washington accounted for 80,100 of the total 2009 Columbia River commercial coho catch. The Columbia River treaty Indian mainstem commercial gillnet coho catch was approximately 9,700 fish, compared to the 2008 catch of 21,600 coho. All Columbia River coho commercial fisheries were non-mark-selective. Coho harvest information for Columbia River commercial and recreational fisheries are presented in Appendix B, Table B-21.

The Buoy 10 and mainstem recreational fisheries below Bonneville Dam harvested 52,100 adult coho compared to 10,800 adult coho in 2008. All Columbia River recreational fisheries in 2009 were markselective for coho. In 2009, Columbia River managers opened the Buoy 10 fishery August 1 with a daily bag limit allowing two adult salmon in August, no more than one Chinook, and beginning September 1 up to three adult salmon with no Chinook retention. The fishery ran through December 31 with the upriver boundary at the Tongue Point, Oregon to Rocky Point, Washington line. The 2009 Buoy 10 harvest and effort totaled 48,127 coho and 72,803 angler trips (Table III-2). Historical Buoy 10 catch and effort data are provided in Appendix B, Table B-22. Recreational coho harvest estimates for Columbia River tributaries were not available.

## Escapement and Management Performance

The overall abundance estimate for OPI area stocks in 2009 was 1,323,200 compared to 736,300 in 2008 and 62 percent greater than the ten-year average of 817,600 (Table III-3; Figure III-1).

## Central California Coast and Northern California Coho

For CCC coho, redd counts have been made for the Lagunitas Creek basin since 1995 and are reported in Table B-7. Fifty two redds were counted as of January 29, 2010. However, the spawning season for this watershed may not be complete and the final redd count may change. Estimates were available for escapement to Klamath River Basin hatcheries, but not for coho spawning in natural areas. In 2009, a total of 2,456 adult coho returned to Trinity River Hatchery and 46 adult coho returned to Iron Gate Hatchery. These values compare to a combined goal of 2,000 adults.

## Oregon Coast Natural Coho

The preliminary estimate of natural spawner escapement in 2009 to Oregon coastal river and lake systems from the Sixes River north (Oregon coast ESU) was 232,900 adult coho. This compares to 165,400 adults in 2008. Historical spawner escapement estimates of naturally produced coho are reported in Table III-1.

Preliminary information, based on random sampling surveys, indicate the highest total natural spawning population on the Oregon coast since 2002. The estimate of the natural spawning population in 2009 was 235,500, including estimates from the Rogue River, which is part of the SONCC ESU (Table III-4, Figure III-2).

Preliminary postseason estimates of combined marine and freshwater exploitation on OCN coho was 10.9 percent, less than the preseason projection of 13.0 percent, and below the 15.0 percent maximum allowed under the FMP and the OCN work group matrix. Preliminary postseason estimates of marine exploitation on RK coho was 2.4 percent, slightly lower than the preseason projection of 2.8 percent, and well below the 13.0 percent maximum ESA consultation standard.

## Oregon Coastal Hatchery Coho

The preliminary estimate of total coho returns to Oregon coastal public hatcheries was 5,600 adults (Table III-1). Hatchery egg-take goals were expected to be met at all public hatchery stations.

## Columbia River Coho

The 2009 ocean escapement of adult early and late Columbia River coho stocks was 721,600 fish, compared to 483,400 adults in 2008 (Appendix B, Table B-21). The 2009 Columbia River coho abundance was sufficient to meet all hatchery brood stock escapement needs.

Preliminary postseason estimates of marine exploitation on LCN coho was 9.8 percent, less than the preseason projected 12.5 percent.

## WASHINGTON COASTAL COHO STOCKS

Washington coastal coho stocks include all natural and hatchery stocks originating in Washington coastal streams north of the Columbia River through the western Strait of Juan de Fuca (west of the Elwha River, inclusive). The stocks in this group most pertinent to ocean salmon fishery management were Willapa Bay (hatchery), Grays Harbor, Quinault (hatchery), Queets, Hoh, and Quillayute coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

## Management Objectives

Management goals for Grays Harbor and Olympic Peninsula coho stocks included achieving natural spawning escapement objectives and treaty Indian allocation requirements. The Council's conservation objectives for stocks managed for natural production were based on maximum sustainable yield (MSY) spawner escapements established pursuant to the U.S. District Court order in Hoh versus Baldrige. The conservation objectives for the Queets, Hoh, and Quillayute rivers were developed as ranges intended to bracket estimates of MSY escapement. The range reflects the degree of uncertainty inherent by using the high estimate of recruits-per-spawner and the low estimate of carrying capacity for the lower bound, and the low estimate of recruits-per-spawner and the high estimate of smolt carrying capacity for the upper end of the range. The ranges were further adjusted upward by 26-184 percent for risk aversion and habitat considerations. However, annual natural spawning escapement targets may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of Hoh versus Baldrige and subsequent U.S. District Court orders. After an annual agreement is reached, ocean fishery escapement objectives are established for each river, or region of origin. The agreement includes provisions for treaty Indian allocation requirements and inside non-Indian fishery needs. No agreements on annual spawning targets for Washington coastal coho other than those in the FMP were made in 2009.

## Regulations to Achieve Objectives

Washington coastal did not play a primary role in 2009 Council-area ocean fishery management because of impact constraints on Interior Fraser (Thompson River, B.C.) and LCN coho stocks. Overall harvest quotas were limited to levels well below those of the late 1980s and early 1990s. All non-Indian ocean coho fisheries north of Cape Falcon were mark-selective. Treaty Indian fisheries were not mark-selective.

## Willapa Bay Coho

## Inside Harvest

Historical terminal run size, harvest and escapement data for Willapa Bay coho are presented in Appendix B, Table B-24. The 2009 gillnet coho harvest in Willapa Bay totaled 74,417 fish. Based on the preseason forecast for a terminal run of 71,350 fish, the scheduled commercial fisheries were expected to harvest approximately 29,903 total coho.

From June 28, 2009 through July 31, 2009, Willapa Bay (Marine Area 2-1) was open for recreational fishing concurrent with the Ocean Marine Area 2 (ocean rules applied). From August 1-15, 2009, Willapa Bay was open to recreational fishing with a daily-bag-limit of six salmon with no more than two adults. From August 16, 2009 through January 31, 2010, Willapa Bay was open to recreational fishing with a daily-bag-limit of six salmon, no more than three adults, of which only two could be Chinook. Chum retention was not allowed. Barbed hooks were allowed August 1, 2009 - January 31, 2010. Expected harvest in recreational fisheries based on preseason forecast abundance was 2,036 coho. Marine and freshwater recreational harvest estimates were not available for 2009, but for 2008, Marine Area 2-1 and freshwater recreational harvest estimates totaled 1,221 fish.

Freshwater recreational fisheries in the Willapa Bay watersheds varied in duration but were generally open for salmon fishing from August 1, 2009 through January 31, 2010 with a daily-bag-limit of six salmon, and no more than two or three adults, one of which could be an unmarked adult coho. Chum retention was not allowed.

## Escapement and Management Performance

Willapa Bay coho were managed primarily for natural production. Estimates of natural spawning escapement for 2009 were not available. The most recent but still preliminary natural escapement estimate available was 18,474 in 2008, which met the WDFW escapement objective of 13,090 natural spawners. Escapement to Willapa Bay hatcheries in 2008 was estimated at 11,897 coho, which met the WDFW escapement objective of 6,100 spawners.

## Grays Harbor Coho

## Inside Harvest

Historical terminal run size, harvest and escapement data for Grays Harbor coho are presented in Appendix B, Table B-26. The run size forecast for Grays Harbor coho, after accounting for ocean fishery impacts, was 119,088 fish ( 57,849 natural and 61,239 hatchery). Treaty Indian and non-Indian gillnet fisheries harvested 29,048 coho (natural, hatchery, and net-pen origin) in 2009. This included 28,487 coho in the Quinault Indian Nation fisheries, 561 in the non-Indian gillnet fishery, and an estimated 3,400 in the Chehalis tribal fishery.

Recreational harvest estimates for 2009 were not available. Marine Area 2.2 was open from September 16 through November 30 for two adult salmon daily, one of which could be an unmarked adult coho, with no Chinook or chum retention.
The Chehalis River and its tributaries were open for coho fishing on the following dates and areas, with a bag limit of two adult coho with no Chinook or chum retention:

- September 16-30, 2009 downstream of the bridge crossing at the town of Porter and closed to fishing for salmon upstream of Lakeside Industries Tower (approximately $1 \frac{1}{2}$ miles upstream of Hwy 101 Bridge) in Aberdeen. No more than one retained coho could be unmarked.
- October 1 through October 15, 2009 from the mouth of the Chehalis River to the high bridge on Weyerhaeuser 1000 line approximately 400 yards downstream of Roger Creek. No more than one adult coho could be unmarked.
- October 16, 2008 through January 31, 2010 from the mouth of the Chehalis River to the high bridge on Weyerhaeuser 1000 line approximately 400 yards downstream of Roger Creek. No unmarked coho could be retained.

The Humptulips River recreational fishery from the mouth to the Hwy 101 Bridge was open September 16 through January 31, 2010 for retention of up to two marked adult coho, with no retention of adult

Chinook, unmarked coho or chum. No more than one adult Chinook could be retained. Bait was prohibited from September 16-30, 2009.

The Quinault Indian Nation operated two separately scheduled gillnet fisheries for Chinook, coho, and chum in the area of the Lower Humptulips and in the area of the Lower Chehalis, as described in Chapter II under the section labeled Grays Harbor Chinook. The expected coho fishery impacts were limited by the expected abundance and harvest of Chinook in the Lower Chehalis side of the fishery and by the expected abundance and harvest of natural coho in the Lower Humptulips side of the fishery. The Humptulips area fishery harvested 11,414 coho, while the Chehalis area fishery harvested 17,073 coho. Harvest levels on the Humptulips fishery were 98 percent over pre-season expected levels while the Chehalis fishery harvest was 20 percent over pre-season expected levels.

## Escapement and Management Performance

Grays Harbor coho were managed for natural production with a spawning escapement goal of 35,400. Natural spawning escapement estimates for 2006, 2007, and 2008 were $17,767,25,121$ and 34,054 , respectively. Failure to achieve the escapement goal of 35,400 for three consecutive years triggers an Overfishing Concern under the terms of the Salmon FMP. An escapement estimate for 2009 Grays Harbor coho was not available.

## Quinault River Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement for Quinault River coho are presented in Appendix B, Table B-28. The treaty Indian gillnet fishery targeted hatchery Chinook and coho from early September through mid-November. A total of 54,902 coho were harvested by the gillnet fishery during the 2009 season.

## Escapement and Management Performance

Quinault River coho were managed for hatchery production. Escapement estimates for Quinault River coho in 2009 were not available. The Quinault National Fish Hatchery egg take objectives for 2009 were achieved.

## Queets River Coho

## Inside Harvest

Historical terminal run size, harvest, and escapement for Queets River coho are presented in Appendix B, Table B-31. Queets River fisheries were managed under preseason agreement with WDFW based on preseason abundance estimates and planned Council ocean fisheries. The treaty Indian gillnet fishery was structured to target returning hatchery and natural coho while also allowing harvest on Chinook that would achieve a total tribal and non-tribal harvest rate of 40 percent. The total harvest of coho in the gillnet fishery was 25,003 commercially landed fish, which was above the expected preseason catch of 9,017 . The gillnet harvest was comprised of a mix of early-timed hatchery fish and normally/later-timed natural fish, with most of the larger than expected catch attributed to a greater hatchery return than expected. A final estimate of the hatchery/natural mix in the catch was not available. Recreational fisheries operated with standard bag limits for coho (no mark-selective restriction) and a standard schedule in the Queets, Clearwater, and Salmon Rivers. Recreational fisheries for Chinook operated in a similar manner as coho, except within Olympic National Park waters where only mark-selective Chinook retention was allowed.

## Escapement and Management Performance

A 2009 natural escapement estimate was not available, but the tribal catch through the season suggested the natural escapement exceeded the escapement floor. The expected natural coho escapement for 2009 based on the preseason effort model was 19,163, with an escapement objective range of 5,800 to 14,500 natural coho. Spawning escapements in 2006, 2007, and 2008 were less than the objective; and therefore triggered an Overfishing Concern, which is being addressed under the terms of the Salmon FMP. Releases of supplemental coho were discontinued after 2004 so there were no returns of those fish in 2009.

## Hoh River Coho

## Inside Harvest

Historical terminal run size, catch, and escapement data for Hoh River coho are presented in Appendix B, Table B-34. The terminal run size of Hoh River wild coho was projected to be 8,392 . The treaty Indian gillnet fishery occurred from the week of September 1 to the week of December 31 (which included Weeks 49 - 52 of Steelhead Management), as described in Chapter II under the section labeled Hoh River Chinook. The tribal fishery harvested approximately 4,294 coho, with 3,609 estimated to be natural origin, including dip-in fish. The non-Indian recreational fishery extended from September 1 through November 30, with the area below Willoughby Creek open and a daily-bag-limit of six salmon, two of which could be adults and no mark-selective coho restriction. The portion of the river between Willoughby Creek and Morgan's Crossing opened October 16 to reduce impacts on spawning spring/summer Chinook in that reach. The river above Morgan’s Crossing did not open for recreational salmon fishing. A catch estimate for the recreational fishery was not available.

## Escapement and Management Performance

The preliminary spawning escapement estimate for natural coho in the Hoh River was 4,615, which was within the escapement goal range of 2,000 to 5,000 established for this stock.

## Quillayute River Coho

## Inside Harvest

Historical terminal run size, catch, and escapement data for Quillayute River summer and fall coho are presented in Appendix B, Table B 37. The recreational and tribal fisheries for coho were established by preseason agreement between WDFW and the Quileute Tribe. A total of 3,645 (1,018 natural) summer coho were harvested in the Quileute Tribe's commercial and ceremonial and subsistence fisheries. An estimate of the 2009 recreational catch was not available.

The Quileute Tribal harvest of fall coho in 2009 was 36,693 (including ceremonial and subsistence catch). Tribal net fisheries harvested 14,906 natural fall coho. An estimate of the 2009 recreational catch was not available.

WDFW reduced the impacts of the recreational fishery on natural summer and fall coho by requiring mark-selective fisheries for coho through October. The Quileute Tribe did not have a closure in their fishery this year, but as in past years, reduced their fishery to 29 hours per week during July and August.

## Escapement and Management Performance

The summer coho run in the Quillayute is managed primarily for its hatchery component, which returns in August and September. The summer coho hatchery rack return was 8,085 . This is well above the goal of 300. An additional 30 natural summer coho were collected as brood stock. The preliminary estimate for
natural summer coho escapement was 978, plus 30 natural brood stock collected from the Sol Duc hatchery.

The preliminary 2009 escapement estimate for natural fall coho was 8,312 plus 50 natural brood stock collected from the Sol Duc hatchery. This was above the escapement goal of 6,300 to 15,800 established for this stock.

## PUGET SOUND COHO STOCKS

Puget Sound coho salmon stocks include natural and hatchery stocks originating from U.S. tributaries in Puget Sound and the eastern Strait of Juan de Fuca (east of Salt Creek, inclusive). The primary stocks in this group that are most pertinent to ocean salmon fishery management were eastern Strait of Juan de Fuca, Hood Canal, Skagit, Stillaguamish, Snohomish, and South Puget Sound (hatchery) coho. Those stocks contribute primarily to ocean fisheries off Washington and B.C.

## Management Objectives

The Council's conservation objectives were based on the Puget Sound Salmon Management Plan, which defined management objectives and long-term goals for these stocks as developed by representatives from Federal, state, and tribal agencies. Conservation objectives for specific stocks were based on either maximum sustainable production for stocks managed primarily for natural production or on hatchery escapement needs for stocks managed for artificial production. The original conservation objectives were developed by a State/Tribal Management Plan Development Team following the Boldt Decision with the goal for natural spawning stocks defined as "the adult spawning population that will, on the average, maximize biomass of juvenile outmigrants subsequent to incubation and freshwater rearing under average environmental conditions." The methodology used to develop the objectives was based on assessment of the quantity and quality of rearing habitat and the number of adult spawners required to fully seed the habitat. Some objectives have subsequently been modified by the U.S. District Court Fisheries Advisory Board and later determinations of the WDFW/Tribal Technical Committee. However, annual natural management objectives may vary from the FMP conservation objectives if agreed to by WDFW and the treaty Indian tribes under the provisions of U.S. versus Washington and subsequent U.S. District Court orders. (see "Memorandum Adopting Salmon Management Plan"; U.S. versus Washington, 626 F. Supp. 1405 [1985]). .

The PSC adopted a management plan for coho salmon originating in Washington and southern B.C. river systems in 2002. The plan was directed at the conservation of key management units, four from Southern B.C. (Interior Fraser, Lower Fraser, Strait of Georgia Mainland, Strait of Georgia Vancouver Island) and nine from Washington (Skagit, Stillaguamish, Snohomish, Hood Canal, Strait of Juan de Fuca, Quillayute, Hoh, Queets, and Grays Harbor). Under the plan, the United States and Canada were required to constrain total fishery exploitation rates to levels associated with the categorical status and target exploitation rates of the key management units as determined by domestic managers. Ceilings on exploitation rates by intercepting fisheries were established through formulas specified in the plan. Categorical status was employed by the PST under the 2002 Coho Agreement to indicate general ranges of allowable total exploitation rates for U.S. and Canadian coho management units in 2009. Three categories were employed: low (total exploitation rate <20 percent), moderate (total exploitation rate 2040 percent), and abundant (total exploitation rate $>40$ percent).

In 2009, the Council adopted annual management objectives for Puget Sound coho as recommended by WDFW and tribal co-managers under provisions of U.S. versus Washington. The annual objectives were based on the PSC categorical status and associated maximum exploitation rate limits as follows:

- Strait of Juan de Fuca (East and West): Low status 40 percent maximum exploitation rate
- Hood Canal: Normal status 65 percent maximum exploitation rate
- Skagit: Low status 35 percent maximum exploitation rate
- Stillaguamish: Low status 35 percent maximum exploitation rate
- Snohomish: Low status 40 percent maximum exploitation rate

The Council formally adopted exploitation rate management objectives for Puget Sound coho in November 2009, which were consistent with PSC objectives, and will replace the longstanding FMP spawning escapement objectives in 2010.

## Regulations to Achieve Objectives

Puget Sound coho stocks did not play a primary role in 2009 ocean fishery management considerations, since management of impacts to Interior Fraser (Thompson River, B.C. Canada) and LCN coho were more constraining. Inside fisheries, primarily in Puget Sound, were constrained by Interior Fraser and to meet PSC objectives for Skagit and Stillaguamish coho. The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on natural Puget Sound coho, LCN coho, OCN coho, and Interior Fraser coho.

## Inside Harvest

Commercial inside harvest of Puget Sound coho was managed on the basis of six regional management units: Strait of Juan de Fuca, Nooksack-Samish, Skagit, Stillaguamish-Snohomish, South Puget Sound, and Hood Canal. Harvest of coho for each management unit is regulated according to the natural spawning escapement or hatchery program escapement goal for that unit. Commercial net and troll harvest (treaty Indian and non-Indian) for all coho stocks combined is presented in Appendix B, Table B38. The 2009 total Puget Sound commercial catch of coho was 218,084 fish, compared to a catch of 211,431 coho in 2008. Non-Indian harvest was 20,668 coho, compared to a catch of 6,468 coho in 2008. Treaty Indian net and troll fisheries harvested 197,416 coho, compared to a catch of 227,483 coho in 2008.

Historical coho catches in the Puget Sound recreational fishery for the years from 1971 through 2008 are listed in Appendix B, Table B-39. Catch estimates for the 2009 Puget Sound recreational fishery were not available.

## Escapement and Management Performance

No post season estimates were available for southern U.S. inside harvest impacts on coho stocks subject to the PSC coho management plan; therefore the 2009 preseason exploitation rate objectives agreed to by WDFW and tribal co-managers could not be evaluated. Preliminary escapement information indicates natural Puget Sound coho escapements were generally average or below average but actual escapement numbers were not available.

Strait of Juan de Fuca coho (both Eastern and Western stocks) were managed as a unit in 2009 for an exploitation rate agreed to WDFW and tribal co-managers under the authority of U.S. versus Washington Court Orders. However, Spawning escapements for the Western stock in 2005, 2006, 2007, and 2008 were less than the objective; and therefore triggered an Overfishing Concern, which is being addressed under the terms of the Salmon FMP.

## BRITISH COLUMBIA COHO STOCKS

## Management Objectives

B.C. coho stocks were managed under the PSC management plan as described in the previous section on Puget Sound coho.

## Regulations to Achieve Objectives

In 2009, Interior Fraser coho were in the "low" status category, which required the total exploitation rate in southern U.S. fisheries not to exceed 10.0 percent. This requirement constrained both Council area and inside fisheries. The preseason expectation was that the total southern U.S. fishery exploitation rate on Interior Fraser coho would be 9.8 percent ( 6.2 percent in Council area fisheries). The mark-selective regulations in ocean and Puget Sound recreational fisheries served to increase harvest of marked hatchery fish while minimizing impacts on wild Interior Fraser coho.

## Inside Harvest

Harvest of coho in inside waters affecting B.C. coho stocks occurred in Puget Sound fisheries, which were described in the previous section of this chapter.

## Escapement and Management Performance

No post season estimates of southern U.S. inside harvest impacts on coho stocks subject to the PSC coho management plan were available. Preseason expectations were for an exploitation rate of 3.3 percent for inside fisheries.

## COASTWIDE GOAL ASSESSMENT SUMMARY

Conservation objective achievement assessments were not available for many coho stocks; however, those that were available all met their objectives. Skagit, Stillaguamish and Snohomish coho spawning escapement estimates were not available but the preseason expectation was for a return less than the FMP objectives. Puget Sound FMP conservation objectives have been updated to reflect PCS based exploitation rate management and will be in place for 2010.

A summary of 2009 performance for coho salmon by stock in relation to the Council's conservation objectives is presented in Table III-5.

TABLE III-1. Estimated returns to Oregon coastal streams and lakes in thousands of adult coho.

| Year | Returns to Hatcheries |  |  | Winchester Dam Count ${ }^{\mathrm{c} /}$ <br> (North Umpqua) | Number of OCN Spawners ${ }^{\text {a/ }}$ |  |  | Inside Harvest Impacts ${ }^{\mathrm{d} /}$ | Ocean Escapement to Oregon Coast ${ }^{a /}$ |

a/ Does not include estimates for the southern OCN component (Rogue River). Spawner escapements to rivers prior to 1990 were estimated by a nonrandom standard index of streams north of the Rogue River. A total coastwide spawner escapement methodology based on stratified random sampling (SRS) was initiated in 1990 and used through 1997 and was implemented concurrently with the standard index methodology. The SRS methodology indicated that actual escapements were less than estimated by the standard rivers index. The spawner index data for years prior to 1990 have been recalibrated in this table to be comparable with the SRS estimates. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used.
b/ Oregon coastal Salmon Trout Enhancement Program (STEP) production from hatchery smolt rearing sites only.
c/ Natural and hatchery fish prior to 1990, unmarked fish only thereafter.
d/ Freshwater sport catch from ODFW salmon/steelhead angler tag information and represents only those fish greater than 24 inches. Includes estimated mortality from hook-and-release.
e/ Preliminary.

a/ Includes boat-based and shore-based fisheries from the new (2000) upstream boundary at the Tongue Point/Rocky Point line downstream to the Buoy 10 line including Clatsop Spit, the South Jetty of the Columbia River, and the North Jetty of the Columbia River after the ocean closed. Fishery was open August 1-30 for Chinook and marked coho, with the daily-bag-limit of two adult salmon, only one of which may be a Chinook, except Chinook retention was prohibited from August 25-30.

a/ The OPI area includes ocean and inside harvest impacts and escapement to streams and lakes south of Leadbetter Pt., Washington.
b/ Includes estimated nonretention mortality: troll fishery--hook-and-release mortality for 1982-2005 and drop-off mortality for all years; sport fishery--hook-and-release mortality for 1994-2005 and drop-off mortality for all years.
c/ Includes returns from Salmon-Trout Enhancement Program (STEP) smolt releases through the 2007 return year, after which the program was terminated.
d/ Ocean fishery impacts on private hatchery stock and returns to private hatcheries are excluded in calculating the OPI area stock aggregate ocean exploitation rate index.
el Preliminary.

a/ A spawner escapement methodology study based on SRS had been in effect from 1990 to 1997 in which coho salmon population estimates have been made for Oregon coastal river systems from the Sixes River and north. Since 1998 a random site selection procedure based on the EPA's Environmental Monitoring and Assessment Program (EMAP) has been used. Spawner population estimates include an adjustment for observation error.
b/ Prior to 1994, the conservation objective was expressed in terms of the total escapement of OCN spawners in index numbers rather than as an exploitation rate. The index escapement objectives from 1981 through 1993 are provided in Table III-2 of the Review of 1998 Ocean Salmon Fisheries and Table 1 of Amendment 11. From 1994 through 1997, Amendment 11 specified that at low stock sizes, only incidental harvest of OCN coho could occur and that impacts could not exceed $20 \%$. Beginning in 1998, the OCN conservation objective has been as specified in Amendment 13 which is also the basis for the NMFS jeopardy standards under the Endangered Species Act listing.
c/ From the coho FRAM, except the estimates prior to 1994 represent the OPI composite exploitation rate for hatchery and natural stocks.
d/ Estimate based on 899 miles of spawner habitat within Nehalem, Tillamook, and Nestucca Rivers and other direct ocean tributaries from Necanicum River through Neskowin Creek.
e/ Estimate based on 1,163 miles of spawner habitat within Siletz, Yaquina, Alsea, and Siuslaw Rivers and other direct ocean tributaries from the Salmon through Siuslaw Rivers.
f/ Estimate based on 1,622 miles of spawner habitat within Umpqua, Coos, and Coquille Rivers. Also includes spawners using tributaries to Siltcoos, Tahkenitch, and Tenmile Lakes.
$\mathrm{g} /$ Estimate based on a mark-recapture methodology and 410 miles of spawner habitat within the Rogue River.
h/ Unreliable estimate.
i/ The Salmon FMP specified an allowable marine and freshwater exploitation rate of $20 \%$, however, the OCN workgroup matrix specified $15 \%$ and the Council chose to manage at the more conservative level for 2005 and 2006.
j/ Preliminary.

| System and Stock | 2009 FMP Conservation Objective | Achievement |
| :---: | :---: | :---: |
| OPI Area Coho <br> (Columbia River and coastal stocks south of Leadbetter Point) | Natural spawner escapement objectives as provided below; meet hatchery egg-take goals; meet treaty Indian obligations. | Hatchery egg-take goals achieved. No information available on catch allocation. |
| Northern California (Threatened) and CCC (Endangered) | No directed coho fisheries or retention of coho south of Humbug Mt. Marine exploitation rate $\leq 13.0 \%$ as indicated by $R / K$ hatchery stocks. Council adopted a projected exploitation rate on R/K hatchery coho of $2.8 \%$. | No fisheries south of the California/Oregon border. Postseason marine exploitation rate estimate of $2.4 \%$ was below the $13.0 \%$ maximum. |
| OCN | Combined marine and freshwater exploitation rate $\leq 15.0 \%$. Council adopted a projected exploitation rate on OCN of $13.0 \%$ | Postseason marine and freshwater exploitation rate estimate of $12.9 \%$ was below $15 \%$ maximum. |
| Columbia River Natural (Threatened) | Combined marine and mainstem Columbia River exploitation rate $\leq 20.0 \%$. Council adopted management measures resulted in a projected marine exploitation rate of 12.5 in Council fisheries\%. | A postseason mainstem Columbia River exploitation rate estimate was not available; the postseason marine exploitation rate of $9.8 \%$ in Council fisheries was below the $12.5 \%$ preseason expectation. |
| Washington Coast Coho | Natural spawner escapement objectives as provided below and in state/tribal agreements; meet hatchery egg-take goals; meet treaty Indian obligations. | Hatchery egg-take goals achieved. No information available on catch allocation. |
| Grays Harbor | 35,400 natural adult spawners. | Escapement estimate is not yet available; pre-season projection was 53,800 . |
| Queets | 5,800 to 14,500 natural adult spawners. | Escapement estimates is not yet available; pre-season projection was 25,500 |
| Hoh | 2,000 to 5,000 natural adult spawners. | Preliminary estimate of 4,600 is within the goal range. |
| Quillayute Fall | 6,300 to 15,800 natural adult spawners. | Preliminary estimate of 8,362 is within the goal range. |

| System and Stock | 2009 FMP Conservation Objective | Achievement |
| :---: | :---: | :---: |
| Puget Sound Coho | Natural spawner escapement objectives as provided below and in state/tribal agreements; meet hatchery egg-take goals; meet treaty Indian obligations and inside nonIndian fishery needs for six management units. | Data not available for 2009 natural spawner escapements. Hatchery egg-take goals likely will be met. |
| Strait of Juan de Fuca | $\leq 40 \%$ total exploitation rate. 12,800 adult spawners. | Preseason expected ocean escapement of 18,300 adult fish for eastern and western Strait of Juan de Fuca combined and a 12\% total exploitation rate. |
| Hood Canal | $\leq 65 \%$ total exploitation rate. 21,500 natural adult spawners. | Preseason expected ocean escapement of 36,100 adult fish and a $47 \%$ total exploitation rate. |
| Skagit | $\leq 35 \%$ total exploitation rate. 30,000 natural adult spawners. | Preseason expected ocean escapement of 27,200 adult fish and a 33\% total exploitation rate. |
| Stillaguamish | $\leq 35 \%$ total exploitation rate. 17,000 natural adult spawners. | Preseason expected ocean escapement of 10,200 adult fish and a $33 \%$ total exploitation rate. |
| Snohomish | $\leq 40 \%$ total exploitation rate. 70,000 natural adult spawners. | Preseason expected ocean escapement of $\mathbf{5 2 , 2 0 0}$ adult fish and a $26 \%$ total exploitation rate. |

Figure III-1. Oregon Production Index (OPI) area coho abundance estimates by stratified random surveys (SRS) accounting methods (1970-2009).

Figure III-2. Oregon coastal natural (OCN) adult coho spawners per habitat mile by coastal region based on SRS accounting methods, 1990-2009.

## CHAPTER IV

## SOCIOECONOMIC ASSESSMENT OF THE 2009 OCEAN SALMON FISHERIES

SUMMARY: Total 2009 exvessel value of the Council-managed non-Indian commercial salmon fishery was $\$ 1.5$ million. There was no commercial fishing permitted in California in 2009 and therefore the West Coast total comprises only Oregon and Washington. In real (inflation-adjusted) dollars, exvessel value was 24 percent above its 2008 level ( $\$ 1.2$ million), which also had no fishing in California. The 2009 exvessel value is 91 percent below a recent five year (2004-2008) average, and 97 percent below the 1979 through 1990 inflation-adjusted average of $\$ 58.7$ million (including pinks). The 2009 average West Coast ocean harvest Chinook price was $\$ 5.70$ per pound. This was $\$ 1.34$ below the 2008 level ( $\$ 7.04$ per pound) and $\$ 0.27$ above the 2007 level ( $\$ 5.43$ ), after adjusting for inflation. The 2009 average Chinook price was the second highest, with 2008 having the highest price, recorded in more than 25 years in inflation-adjusted terms. At $\$ 2.03$ per pound, in inflation-adjusted terms, average 2009 West Coast coho prices were 22 percent lower than in 2008, 10 percent higher than in 2007, and 1 percent lower than a recent five year average (2004-2008). The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2009 was 188,800, an increase of 181 percent from 2008, and 69 percent less than the 1979 through 1990 average. The total West Coast income impact associated with recreational and commercial ocean salmon fisheries for all three states combined was estimated at $\$ 17.0$ million in 2009. In inflation-adjusted dollars this was over twice the estimated 2008 level ( $\$ 7.4$ million). Year 2009 has the second lowest income impacts on record with 2008 having the lowest on record and 2006 as the third lowest with $\$ 36.2$ million (inflation adjusted).

## ALLOCATION OF THE SALMON RESOURCE

Salmon management by the Council involves numerous allocation issues including:

- Determination of the amount of salmon available for ocean harvest after consideration of expected abundances, harvests by inside fisheries, and spawning escapement goals.
- Allocation of harvest among broad management areas and among port areas within the management areas.
- Allocation of harvest between Indian and non-Indian harvesters.
- Allocation of the non-Indian harvest between commercial and recreational harvesters.

The amount of salmon available for harvest in Council management areas depends, in part, on harvest in Canada and Alaska. Allocation of harvest between the West Coast, Canada, and Alaska is determined within the constraints of the PST.

In general, the recreational fishery has tended to have a more stable harvest than the commercial fishery (in both absolute and relative terms) (Figures IV-1 and IV-2). The majority of the annual variation in available ocean harvest is usually taken up in the commercial fishery. However, both fisheries have suffered substantial declines relative to harvest levels of the 1980s, the effects of which are amplified within specific geographic areas.

Decisions on allowable harvests for a particular stock often have implicit allocation effects on the geographic distribution of salmon harvest. Seasons may be more restrictive along a particular area of the coast to protect a depressed stock encountered in that area at a higher rate than other areas. The geographic distribution of harvest opportunity along the coast involves balancing the often conflicting objectives of maximizing ocean harvest and fairly distributing the responsibility for resource conservation. A brief outline of the regulatory objectives which shaped the 2009 season is provided in Chapter I; and an assessment of success in meeting the objectives is provided in Chapters II and III.

## COMMERCIAL SALMON FISHERIES

## West Coast Non-Indian Commercial Ocean Fishery

## Inseason Price Trends

Monthly exvessel price data provide information on seasonal price trends (Table IV-1). Oregon and Washington 2009 Chinook prices were at their highest in May, reaching over $\$ 6.50 /$ pound. Oregon and Washington Chinook prices were at their lowest in July and September, respectively. Coho prices increased steadily through the season.

## Annual Trends (Seasons, Value, Prices, and Pounds)

Available information on Chinook and coho exvessel price and value by species, compiled from state fish receiving tickets and expressed both in nominal terms and inflation-adjusted 2009 dollars, is presented in Tables IV-2, IV-3, and IV-4. Data on pink salmon are provided in Table IV-5. The gross domestic product implicit price deflator, developed by the Bureau of Economic Analysis, was used to adjust nominal values for inflation (Appendix D, Table D-22). Weights of landings by species and port for Chinook and coho are presented in Tables IV-6, IV-7, and IV-8. These tables and the following discussion refer to the non-Indian commercial fishery in Council management areas and associated state territorial ocean area waters.

Total 2009 exvessel value of the Council-managed non-Indian commercial salmon fishery was $\$ 1.5$ million, which is the second lowest on record. In real (inflation-adjusted) dollars, exvessel value was 24 percent above its 2008 level ( $\$ 1.2$ million) and 97 percent below the 1979 through 1990 inflation-adjusted average of $\$ 58.7$ million (including pinks), and 92 percent below the 2004-2008 inflation-adjusted average of $\$ 16.1$ million (including pinks). Excluding 2008, the exvessel value closest to the 2009 value was \$7.1 million in 1998.

California did not have a commercial salmon fishery in 2009 or 2008. In 2007 the exvessel value of the California commercial ocean salmon catch was $\$ 8.2$ million and the 1979-2008 average was $\$ 18.1$ million (inflation adjusted). The 2009 exvessel value for the Oregon commercial catch ( $\$ 345$ thousand) was down 31 percent from the 2008 value, and 98 percent below the 1979 through 1990 average ( $\$ 18.5$ million), in inflation-adjusted terms. The 2009 exvessel value for the Washington non-Indian ocean commercial catch ( $\$ 1.2$ million) was up 63 percent from the 2008 value ( $\$ 717$ thousand). Over the last eight years (2002-2009) exvessel values of Washington landings have been the highest since 1993 (\$1.1 million, inflation-adjusted), but 2009 values were still 86 percent below the 1979 through 1990 inflationadjusted average of $\$ 8.3$ million.

The 2009 average West Coast ocean harvest Chinook price was $\$ 5.70$ per pound, which is the second highest in the last 25 years. Years 2008 and 2007 had high Chinook price per pound with $\$ 7.04$ and $\$ 5.43$ per pound, respectively (inflation adjusted). Chinook 2006-2009 prices compared to previous years have not been this high since 1979, which had an average inflation-adjusted price of $\$ 6.64$ per pound. One of the main reasons 2009 prices were so high was due to the extremely restricted 2009 fishing season (see Chapter I and Appendix C for details). The 2009 price was 15 percent above the recent five year (2004-2008) average (\$4.94), in inflation-adjusted terms and 22 percent above the 1979-1990 average (\$4.66). At $\$ 2.03$ per pound, in inflation-adjusted terms average 2009 West Coast coho prices were 22 percent lower than in 2008, 10 percent higher than in 2007, but 32 percent lower than the 1979-1990 average.

In terms of number of fish, the 2009 coastwide, non-Indian commercial Chinook harvest (13,500 fish) decreased by 8 percent compared to 2008 (Figure IV-1). Historically, 2009 harvest of Chinook was the
lowest on record. The number of Chinook harvested was 98 percent below the long-term average 19762008, 711,000 Chinook). The coastwide average weight per Chinook ( 12.6 pounds) increased by 11 percent compared to 2008 (Appendix D, Tables D-2, and D-3). Coho catch increased in 2009 to 42,000 fish, over 18 times the 2008 coho harvest $(2,100)$ and the second highest harvest since 1992. The coastwide average weight per coho ( 6.4 pounds) decreased 24 percent from 2008 ( 8.4 pounds), which was the second highest average weight for 1980 to the present. The highest weight in that time frame was 8.5 pounds in 2006. The coastwide coho exvessel value was $\$ 543$ thousand in 2009, which is almost 11 times more than in 2008 ( $\$ 46$ thousand) and over twice the 2007 coho exvessel value ( $\$ 249$ thousand), in inflation adjusted values (Figure IV-4). In 2009 the two ports with the most Chinook harvest (by weight) were Westport ( 55 percent) and Neah Bay ( 22 percent), whereas in 2008, Astoria ( 24 percent) and Westport (30 percent) were the two ports with the highest Chinook take (by weight). In 2009, North of Cape Falcon comprised about 95 percent of coastwide Chinook harvest (by weight) and there was no Chinook harvest in California. In 2008, North of Cape Falcon also comprised 84 percent and no Chinook harvest in California. Compared with 2008, Chinook harvest (by weight) in 2009, down 77 percent in Oregon and up 55 percent in Washington. The 2009 coho harvest (by weight) was nearly 35 times what it was in Oregon, compared to 2008, and nearly 9 times what it was in Washington, compared to 2008 (no coho were harvested in California in either year).

## Ocean Commercial Salmon Harvesters

Based on Pacific Coast Fisheries Information Network (PacFIN) data, 282 vessels participated in the West Coast commercial salmon fishery in 2009. This is up 45 percent from 2008 but down 72 percent from the 2007 total of 1,007 vessels. The coastwide vessel counts from PacFIN are lower than the totals derived from summing Appendix D state-level tables (Tables D-4, D-5, and D-6) because vessels may participate in more than one state and because of differences in the degree of data completeness at the time the 2009 data were summarized.

In 2009 and 2008, no California vessels landed salmon. In 2007, the active fleet in California was 601 vessels and in 2006, it was 477 vessels (Table D-4). In Oregon, the active fleet increased by 86 vessels in 2009 with 224 vessels compared to 138 vessels in 2008 (Table D-5). The active fleet in Washington increased by 11 to 97 vessels landing salmon in 2009 (Table D-6). Coastwide, the number of limited entry salmon permits issued in 2009 decreased by 78 from the previous year, to 2,477 . Landings were made on 13 percent of all permits in 2009, up from 9 percent in 2008 and down from 44 percent in 2007. Years 2009 and 2008 are the lowest vessel participation years on record (1982-2008). From 1982 to 1993 an average of 5,193 of 7,942 total permits ( 65 percent) were used on an annual basis. Harvest opportunity began declining substantially at that time and some permits were purchased in a buyback program.

Coastwide in 2009, average per vessel inflation-adjusted exvessel value of salmon landings decreased 13 percent compared to 2008, to $\$ 4,717$ per vessel. Compared to 2008, 2009 average per vessel exvessel revenue was down 58 percent in Oregon, and up 41 percent in Washington. Some caution needs to be exercised in interpreting the per vessel average. For example, the averages may be influenced as much by the entry or exit of a disproportionate number of small or large harvesters from one year to the next as by a change in the average revenues of those vessels remaining in the fishery.

Additional historical information on landings by vessel size, percentages of the fleet responsible for the majority of harvest, and harvest by residence of those participating in the fishery off each state is provided in Appendix D.

## West Coast Treaty Indian Commercial Ocean Fishery

Treaty Indian commercial fisheries off Washington operate under regulations established by the Council. While some of the treaty Indian harvest was for ceremonial and subsistence purposes, the vast majority of
the catch was commercial harvest. Commercial treaty Indian fisheries provide food to consumers and generate income in local and state economies through expenditures on harvesting, processing, and marketing of the catch. From May through September $15^{\text {th }}$, the treaty Indian ocean troll fishery harvested 13,000 Chinook ( 104,900 pounds), 60,100 coho ( 343,700 pounds) in 2009, compared with 21,800 Chinook ( 164,300 pounds), 14,300 coho ( 122,700 pounds) in 2008 (Tables A-15 and D-3). For all of 2009 the preliminary exvessel value of Chinook and coho landed was $\$ 1.0$ million and the inflation adjusted exvessel value in 2008 was $\$ 0.9$ million (values based on PacFIN data).

## Columbia River Commercial Fishery

Harvest in the ocean salmon fisheries affect inriver fisheries by affecting the number of fish available for inside treaty Indian and non-Indian harvest. Table IV-9 shows the exvessel value of Columbia River commercial harvest of Chinook, coho and chum salmon. All prices and values in the table and the following discussion are reported in inflation-adjusted dollars. Exvessel prices for inriver catches of Chinook vary considerably with race (spring versus fall Chinook) and stock (tules versus brights). Spring Chinook generally bring the highest prices and tule fall Chinook and chum the lowest.

Total 2009 exvessel value of commercial salmon harvested in the Columbia River was $\$ 5.8$ million. This was 24 percent below the inflation-adjusted 2008 ( $\$ 7.7$ million) level. Total exvessel value for non-Indian commercial salmon harvested in the Columbia River was $\$ 3.6$ million in both 2008 and 2009 (Table IV$9)$.

The total 2009 exvessel value of treaty Indian salmon harvested in the Columbia River and sold on fish tickets was $\$ 2.2$ million. This is 46 percent below the 2008 ( $\$ 4.1$ million) value. Note that these values include only those sales made to licensed fish buyers. Treaty Indian fisher sales to the public are accounted for in harvest monitoring (Table B-20), but estimates of the pounds and value of such sales were not included in Table IV-9.

## Other Inside Commercial Fisheries

## Puget Sound and Washington Coastal Inside Fisheries

Information on 2009 Puget Sound and Washington coastal inside fisheries is preliminary. Based on PacFIN data, the 2009 exvessel value reported for all salmon species taken in the commercial non-Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) was $\$ 4.4$ million. Of this, $\$ 1.3$ million was for Chinook and coho. In 2008, the total inflation-adjusted exvessel values for the commercial non-Indian salmon fisheries in these areas were $\$ 4.5$ million for all salmon species and $\$ 1.0$ million for Chinook and coho (adjusted for inflation). The 1981 through 2008 inflation adjusted average exvessel value is $\$ 17.5$ million with $\$ 4.4$ million for Chinook and coho.

The preliminary 2009 exvessel value reported to PacFIN (as of January 22, 2010) for all salmon species taken in the commercial treaty Indian fisheries in Puget Sound and Washington coastal inside fisheries (excluding the Columbia River) was $\$ 4.5$ million. Of this, $\$ 3.9$ million was for Chinook and coho. In previous years, substantial additional landing reports have come in after publication of this review. The values for 2008 were $\$ 12.5$ million for all salmon species and $\$ 7.9$ million for Chinook and coho (adjusted for inflation). The 1981 through 2008 inflation adjusted exvessel value is $\$ 21.8$ million with $\$ 8.2$ million for Chinook and coho.

## Klamath River Fisheries

Commercial sales in the Yurok and Hoopa Valley Reservation Indian fall gillnet fisheries in the Klamath River occurred in 1987-1989, 1996, 1999-2004, and 2007-2009. Average commercial catch of fall Chinook was 17,400 in those years, most of which occurred in the estuary. Commercial sales also
occurred in spring gillnet fisheries in 1989, 1996, 2000-2004, and 2007-2009, with an average of about 1,400 fish sold. The 1989 harvest of 27,700 Chinook was sold for $\$ 852,000$ (unadjusted for inflation, $\$ 1.3$ million adjusted to 2009 dollars) and had an average per fish weight of 15.4 pounds. For the 1996 harvest of 3,129 spring Chinook and 40,147 fall Chinook, the value at first sale was estimated at $\$ 525,000$ (unadjusted for inflation, $\$ 693,000$ adjusted to 2009 dollars). The average weight per fish landed in 1996 was 13.5 pounds. Records were not available for the weight and value of harvests after 1996 as each Indian fisher now markets their fish independently. In recent years the fishery has occurred fairly regularly with the exceptions of 2005 and 2006. The commercial fall Chinook harvest was 15,700 Chinook in 2009, compared to 12,200 Chinook in 2008 (Appendix B, Table B-5).

## CEREMONIAL AND SUBSISTENCE SALMON FISHERIES

In addition to the commercial Indian fisheries discussed above, fish are taken in Indian fisheries each year for ceremonial and subsistence purposes. Estimates of the amount of salmon used for ceremonial and subsistence purposes are documented in Appendix B. Discussion of the importance of ceremonial and subsistence fish to Indian communities is presented in Appendix B to Amendment 14 of the salmon FMP.

## RECREATIONAL SALMON FISHERIES

## Ocean

The preliminary number of vessel-based ocean salmon recreational angler trips taken on the West Coast in 2009 was 188,800 , an increase of 181 percent from 2008, but 69 percent less than the 1979 through 1990 average. Compared with 2008, preliminary estimates of the number of trips taken in 2009 increased by over 170 percent in both Oregon, and Washington. California effort was up substantially in comparison to 2008 but redistributed to the north and still severely depressed compared to historic levels. Note that Washington effort estimates in Tables IV-10 and IV-13 differ from those in Tables I-4 and Appendix A Table A-17 because the former exclude bank effort from the Columbia River north jetty.

Recreational salmon fishing takes place primarily in two modes, (1) anglers fishing from privately owned pleasure crafts, and (2) anglers employing the services of the charter boat fleet. In general, success rates on charter vessels tend to be higher than success rates on private vessels. Small amounts of shore-based effort directed toward ocean area salmon occur, primarily from jetties and piers. Coastwide, the proportion of angler trips taken on charter vessels in Washington, Oregon and California was relatively stable, declining from 24 percent in 2008 to 23 percent in 2009 with a decline in the charter trips proportion in California and Washington and an increase in Oregon. Figure IV-5 and Tables IV-10, IV11, IV-12, and IV-13 display details of effort and catch by port area and mode for each state.

## California

The California fishery was closed with the exception of late season opening that occurred in the Crescent City and Eureka areas. There were 5,400 trips during that opening, compared to 2008, where only Fort Bragg had an opening with 391 angler trips. There were 673 Chinook caught on the 5,400 trips with 570 Chinook caught on 4,700 private vessel trips. There were 0.127 fish per trip for the opening.

## Oregon

Ocean recreational salmon trips in 2009 in Oregon were up 178 percent to 84,600 trips from an estimated 30,400 angler trips in 2008 (Tables IV-10 and IV-12). Total 2009 trips were 5 percent above the most recent five year average (2004 through 2008). Newport effort was up 440 percent and Astoria effort up 235 percent, compared to 2008. The other Oregon port areas have an increase in effort ranging from 24 percent in Brookings to 145 percent in Tillamook. The charter industry share of Oregon recreational salmon trips in 2009 was about 15 percent, which was more than double 2008 but similar to other recent years (Figure IV-5 and Table IV-12).

From 1984 to 1993, coho comprised 87 percent of the Oregon recreational ocean salmon catch, on average. From 1994 through 1998 the lack of opportunity to retain coho south of Cape Falcon generally resulted in much lower angler success rates. With the opportunity to retain coho in mark-selective fisheries south of Cape Falcon beginning in 1999, salmon retention rates increased 75 percent in 1999 to 0.43 salmon per angler day, from 0.25 in 1998. From 2002 through 2008, retention rates ranged between 0.44 and 1.07 salmon per angler day. The retention rate for 2009 was slightly higher than this range at 1.08. Coho contributed $98 \%$ of the catch.

## Washington

In 2009, 98,900 ocean angler trips were taken on vessels on the Washington coast (Tables IV-10 and IV13 ), an increase of 172 percent from the 36,400 trips taken in 2008, and 33 percent above the recent five year average (2004-2008). The proportion of Washington angler trips taken on charter vessels was 30 percent in 2009, down from 39 percent in 2008, (Figure IV-5 and Table IV-13), and the lowest charter share on record (1979 to the present).

Angler success rates (in terms of retained fish per angler trip) increased to 1.52 in 2009, up from 0.92 in 2008 and 1.28 in 2007. The retention rate averaged 1.49 salmon per trip between 1979 and 1990 and 1.28 salmon per trip since then. Note that these figures do not include angler effort that occurs from the ocean side of the Columbia River jetty, or angler effort in the state managed Area 4B add-on fishery, when open.

In an effort to increase angler participation in non-salmon recreational fishing (e.g., bottomfish trips) and to extend the length of the salmon season, partial-week closures were used in the recreational fishery north of Cape Falcon beginning in 1985. Sunday through Thursday salmon openings were used beginning in 1996 in the Westport and Columbia River port areas. The Neah Bay and La Push areas were generally open seven days a week, until more recently. In 2009, the recreational salmon fishery was open seven-days-per-week in the Columbia River area (south of Leadbetter Point). All open ports north of Leadbetter Point started the year with partial week openings but switched from partial week openings to a seven-day-per-week fishery in mid- to late-July. In 2009, north of Cape Falcon there were 37,200 bottomfish trips, a decrease from the 44,400 trips in 2008 (Table IV-14). The decline was distributed across all port areas.

## Buoy 10 and Area 4B Add-On Fisheries

For anglers fishing from private and charter boats, angler retention rates in the Buoy 10 fishery increased from 0.52 salmon per angler day in 2008 to 0.75 salmon per angler day in 2009. Private and charter boat effort in 2009 was up 124 percent, compared with 2008, to about 72,800 trips (Table IV-15).

In 2000, about 3,400 trips were made in the late-season Area 4B add-on fishery. Since that time there have been no late season Area 4B add-on fisheries (Table IV-15) except in 2008, which had an estimated 782 private trips and no charter trips.

There were numerous other inside recreational salmon fishing opportunities in Puget Sound and coastal streams and estuaries that are not discussed in this chapter of the Review. See Appendix B for estimates of harvest in some of those other fisheries.

## SALMON FISHERY INCOME IMPACTS AND COMMUNITY DEPENDENCE

Coastal community income impacts provide information on the effects of fluctuations in salmon harvest on local economies and small businesses. Income impacts are estimated per commercial pound and per
recreational fishing day, and were generated using the Fishery Economic Assessment Model (FEAM). Information on FEAM is available from the Council on request.

Estimated state and local community income impacts of commercial and recreational ocean salmon fisheries and selected state-managed fisheries are shown in Tables IV-16 through IV-20. These impacts represent estimates of total personal income associated with harvesting, processing and first level distribution activities in the commercial and recreational salmon fisheries at the local community (county) and state levels. Income impacts are estimated based on several components: reported landings by area, an inventory of area fleet and processors, estimates of fleet and processor expenditures, surveys of the expenditure patterns of recreational fishers, and local and state level total income coefficients generated by IMPLAN ${ }^{\circledR}$ models constructed for each area. In FEAM, most of the benefit of higher than average salmon prices was assumed to go to the harvesters. Commercial ocean harvest not landed in the coastal areas (e.g., landed in Puget Sound ports) was not included in the estimates of coastal community impacts, but was included in the overall estimate of state impacts.

The impacts presented here are estimates of annual trends and are intended to indicate the possible redirection of activity between nonfishing-dependent and fishing-dependent sectors. As such they represent likely upper bounds on the local community and state income impacts generated by West Coast salmon fisheries. All income impact estimates in this review are reported in inflation-adjusted 2009 dollars.

## West Coast Ocean Fishery Income Impacts

The total West Coast income impact associated with recreational and commercial ocean salmon fisheries for all three states combined in 2009 was $\$ 17.0$ million, which was the second lowest on record. In inflation-adjusted dollars this was $130 \%$ above the estimated 2008 level ( $\$ 7.4$ million) and 95 percent lower than the inflation-adjusted value for 1979 (the highest year in the data time series). The 2009 value was 66 percent below the inflation-adjusted average of $\$ 50.2$ million for the previous five years 20042008 (Tables IV-16 through IV-18). West Coast income impacts associated with the 2009 non-Indian commercial ocean fishery were $\$ 2.5$ million, 40 percent higher than 2008 ( $\$ 1.8$ million), and 91 percent below the recent five year (2004-2008) average ( $\$ 27.3$ million), in inflation-adjusted terms; ${ }^{1 /}$ Income impacts related to the 2009 ocean recreational fishery were estimated at $\$ 14.5$ million, $159 \%$ above the 2008 level ( $\$ 5.6$ million), and 37 percent below the 2004-2008 average in inflation-adjusted terms ( $\$ 22.9$ million). These coastwide values do not reveal the reductions in particular communities compared with averages during the 1980s. Tables IV-16 through IV-18 provide greater detail on the impacts in individual states and port areas along the West Coast.

## Selected Inside Fisheries

## Columbia River Commercial Fisheries

For periods in the past, the non-Indian and treaty Indian Columbia River commercial fisheries have generated a substantial amount of income for the Oregon and Washington communities on the Columbia River, an average of $\$ 33.0$ million from 1986-1990 (inflation-adjusted). For 2009, income impacts associated with the Columbia River commercial catch (non-Indian and treaty Indian) were estimated at $\$ 12.2$ million. The income impacts in 2008 were $\$ 14.8$ million and $\$ 7.1$ million in 2007 (all values in inflation-adjusted 2009 dollars, Table IV-19).

1/ Income impact estimates for the commercial fishery do not include postseason settlement payments fishers may have received from buyers. These postseason settlements may be particularly significant for the California fishery.

## Buoy 10 and Area 4B Add-On

The estimated local community income impact associated with the 2009 Buoy 10 recreational fishery was $\$ 2.7$ million, slightly over twice the inflation-adjusted 2008 level of $\$ 1.3$ million, and 62 percent below the 1987-1990 inflation-adjusted average of $\$ 7.2$ million (Table IV-20). There was not a late season Area 4B add-on fishery this year. There was one last year, which was the first since 2000. The local community income impact associated with the area 4B add-on in 2008 was $\$ 30,100$. Between 1996 and 2000, the average annual inflation-adjusted total state-level income impact associated with the Area 4B add-on fishery was $\$ 136,200$ (Table IV-20).

a/ These exvessel values do not include the postseason settlement payments some fishers may have received from buyers and therefore may underestimate the true payments received by fishers for their landings. Beginning circa 1999, these postseason settlements are believed to have grown for the California fishery. For 2002, the exvessel value reported here is believed to be under reported by roughly $5 \%$ to $10 \%$.
b/ Does not include pink salmon landings, if any.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.
b/ Does not include pink salmon landings.
c/ There was no legal coho fishery in 1988. The value used in this average for 1988 is for landings of fish caught south of Cape Falcon and seizures of illegal fish.
d/ In 1994-1996 Chinook were caught off Oregon and landed in Washington. Value information was not provided to preserve confidentiality.

a/ All values in this table are based on preliminary information available at the start of each year's salmon review.
b/ The major port areas listed may include smaller ports as follows: Neah Bay includes only Neah Bay; La Push also includes Kalaloch; Westport also includes Aberdeen, Bay City, Copalis Beach, Hoquiam, Moclips, Taholah, Bay Center, Grayland Beach, Raymond, South Bend, and Tokeland; Ilwaco also includes Long Beach, Nahcotta, Naselle, and all Columbia River Ports; Puget Sound includes all Puget Sound ports east of Neah Bay.
c/ State total includes landings where port of landing is not specified.
d/ There was no ocean commercial fishery for Chinook north of Cape Falcon; however, Chinook were caught off Oregon and landed in Washington.
e/ Less than 500 pounds.

a/ Excluding pink, sockeye, and steelhead.
b/ Mainstem below Bonneville and select areas (Youngs Bay, Tongue Point, Blind Slough, and Deep River).
c/ Treaty Indian landings and values do not include direct sales to consumers.
d/ For Washington, this column includes fall brights, tules, and jacks. Price changes may reflect a change in the mix of brights, tules, and jacks rather than annual price changes.
e/ Gillnet exvessel salmon prices are recorded in round weight and therefore are not strictly comparable to exvessel troll prices.
f / Less than $\$ 500$ or 500 pounds.
$\mathrm{g} / \mathrm{Preliminary}$. (All Washington values in this table are based on preliminary information available when each year's Salmon Review is drafted.)
$\mathrm{h} /$ Washington prices for years prior to 2000 are based on a combination of Washington and Oregon value information.
i/ Treaty Indian values are primarily mainstem Columbia set gillnet but also include Klickitat dipnet, Drano Lake (Little White Salmon River mouth), and Priest Rapids Pool fisheries.

a/ Catch numbers may include some illegal harvest.
b/ Fewer than 50 fish.
c/ Preliminary.
d/ Salmon data from surveyed ports only. These generally include Astoria, Garibaldi, Depoe Bay, Newport, Winchester Bay, Coos Bay, and Brookings. Since 1981, Pacific City and Florence have also been included. Gold Beach data are included from 1981-1987. Astoria was not included in 1994.
e/ Numbers do not include angling from the Columbia River jetty.
$\mathrm{f} /$ Numbers do not include angling from the Columbia River jetty or from the late-season state waters Area 4B fishery. g/ Values for 1982-1985 include some inriver Columbia River fishing after closure of the ocean fishery.

a/ Does not include effort from the late-season state water Area 4B fishery, when open.
b/ Does not include effort from the Columbia River Jetty.
c/ Values for 1984 and 1985 include some Columbia River fishing after closure of the ocean fishery.
d/ Fewer than 50 angler trips.
e/ Preliminary.

a/ Fewer than 50 angler trips.
b/ Preliminary.
c/ Columbia River north jetty was not sampled in 2005 and 2007 due to construction limiting access.
$\mathrm{d} /$ Oregon data is a minimum estimate, as the jetty is not sampled, and bottomfish sampling of vessels only occurs when the ocean is open for salmon.
e/ No Oregon bottomfish trips are included.
f/ Includes tuna trips: Ilwaco - 9 charter, 14 private; Westport - 784 charter, 0 private.
g/ Annual sturgeon angler trips for the lower Columbia River from the western tip of Puget Island to mouth.

a/ Starting in 2000, includes catch upstream from the Astoria-Megler Bridge to the new boundary line from Tongue Point, Oregon to Rocky Point, Washington. Prior to 2000
includes only downstream from the Astoria-Megler Bridge.
b/ Prior to 1987, data on charter and private anglers were combined. Total Buoy 10 catch and effort data prior to 1987 are provided in Table B-21.
c/ Preliminary.
There was no Area 4B add-on fishery prior to 1989.
e/ There was no Area 4 B add-on fishery opening because the Area 4 ocean quota was not attained.
f / There was no Area 4B add-on fishery planned.

a/ Per pound and per day estimates of income impacts provided from output of the Fishery Economic Assessment Model (FEAM). These are the income impacts associated with expenditures in the troll or recreational sectors. There is no differentiation between money new to the area and money which would otherwise have been expended in other sectors. It is assumed that all fish landed at a port is processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 U.S. Forest Service IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 U.S. Forest Service IMPLAN data. Beginning in 2001 values are based on a 2003 run of the FEAM using 1998 U.S. Forest Service IMPLAN data.
b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.
c/ Excluding pink salmon.
d/ Preliminary.

a/ Per pound and per day estimates of income impacts provided by the FEAM. These are the income impacts associated with expenditures in the troll or recreational sectors. There is no differentiation between money new to the area and money which would otherwise have been expended in other sectors. It is assumed that all fish landed at a port is processed in the port area. Values through 1995 are based on a 1992 run of the FEAM using 1989 U.S. Forest Service IMPLAN data. Values from 1996 through 2000 are based on a 1998 run of the FEAM using 1996 U.S. Forest Service IMPLAN data. Beginning in 2001 values are based on a 2003 run of the FEAM using 1998 U.S. Forest Service IMPLAN data.
b/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.
c/ Excluding pink salmon.
d/ Preliminary.

b/ Recreational values exclude recreational shorebased effort from the Columbia River north jetty.
c/ Total personal income impacts on coastal areas. Totals do not include impacts of one coastal area on another.
d/ Through 1993, commercial values include a very small amount of fish landed in Washington coastal areas not included in the major port groups.
e/ Excluding pink salmon.
f/ All commercial values in this table are based on preliminary information available at the start of each year's Salmon Review. $\mathrm{g} /$ The non-Indian commercial and recreational fisheries were closed north of Cape Falcon in 1994. Some commercial catch taken south of Cape Falcon was landed in the Puget Sound area.

a/ Summary of ODFW fish receiving ticket information. Excludes effort occurring off Alaska, Washington, and California. Days fished data are reported by port of landing prior to 1979 and by area of catch after 1978. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1986 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1986 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.
b/ Preliminary

a/ Excludes harvests off Alaska, Washington (north of Leadbetter Point), and California that were landed in Oregon. Landings are reported by port of landing through 1978 and by area of catch beginning in 1979. Catch and landing areas include the following port areas: Astoria area includes Oregon ports from Astoria through Cannon Beach; Tillamook area includes Nehalem through Pacific City; Newport area includes Depoe Bay through Waldport; Coos Bay area prior to 1988 includes Florence through Bandon and after 1987 includes Florence through Port Orford; Brookings area prior to 1988 includes Port Orford through Brookings and after 1987 includes Gold Beach through Brookings. Values include state-waters only terminal area fisheries.

a/ Monthly totals are the sum of statistical weeks with closest fit to the calendar month. The 1976-1980 effort is from combined salmon/steelhead punch card and sampled port data. Since 1981, data from sampled ports only. Effort since 1979 consists of salmon angler trips only. Data prior to 1979 include combined bottomfish and salmon trips. Astoria area includes Astoria, Warrenton, and Hammond; Tillamook area includes Garibaldi and Pacific City; Newport area includes Depoe Bay and Newport; Coos Bay area includes Florence, Winchester Bay, and Coos Bay; Brookings area includes Gold Beach and Brookings. Values include state-waters only terminal area fisheries

a/ Monthly totals for Oregon data are the sum of statistical weeks with closest fit to the calendar month. Washington data are summarized by statistical month.
b/ Preliminary.
c/ Treaty troll effort in number of landings, which closely approximates days fished because treaty Indian fishers do not usually make multi-day trips. Season totals do not include January-April, October, or November-December treaty troll effort.

## APPENDIX B <br> HISTORICAL RECORD OF ESCAPEMENTS TO INLAND FISHERIES AND SPAWNING AREAS

## LIST OF TABLES

Page
TABLE B-1. California Central Valley natural area fall Chinook salmon spawning escapement in numbers of fish ..... 193
TABLE B-2. California Central Valley hatchery fall Chinook salmon escapement in numbers of fish ..... 194
TABLE B-3. Sacramento River late-fall, winter, and spring Chinook salmon spawning escapement in numbers of fish ..... 195
TABLE B-4. Summary of Klamath River fall Chinook salmon estimates in numbers of adults and jacks ..... 196
TABLE B-5. Estimates of Yurok and Hoopa Valley reservation Indian gillnet Chinook harvest in numbers of fish ..... 197
TABLE B-6. Shasta, Scott, and Salmon rivers fall Chinook salmon spawning escapement estimates in numbers of fish ..... 198
TABLE B-7. Summary of California North Coast salmon spawning stock surveys in numbers of fish or redd counts ..... 199
TABLE B-8. Peak spawning counts in index areas for selected south/local migrating Oregon coastal fall Chinook stocks ..... 200
TABLE B-9. Counts of natural and hatchery spring Chinook salmon at Gold Ray Dam on the Rogue River and at Winchester Dam on the North Umpqua River in thousands of fish ..... 201
TABLE B-10. Rogue River fall Chinook carcass counts in numbers of fish ..... 202
TABLE B-11. Peak counts for north migrating Oregon coastal Chinook stocks on selected fall Chinook spawning index stream surveys ..... 203
TABLE B-12. Estimates of minimum inriver run size, catch, and escapement in numbers of Columbia River adult spring Chinook destined for areas below Bonneville Dam ..... 204
TABLE B-13. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult spring Chinook destined for areas above Bonneville Dam ..... 205
TABLE B-14. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult summer Chinook destined for areas above Bonneville Dam ..... 206
TABLE B-15. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult Spring Creek Hatchery (SCH) stock fall Chinook ..... 207
TABLE B-16. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult lower river hatchery (LRH) stock fall Chinook ..... 208
TABLE B-17. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult lower river wild (LRW) stock fall Chinook ..... 209
TABLE B-18. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult upriver bright (URB) stock fall Chinook destined for areas above McNary Dam and the Deschutes River ..... 210
TABLE B-19. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult mid-Columbia bright (MCB) stock fall Chinook destined for areas below McNary Dam, not including the Deschutes River ..... 211
TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River ..... 212
TABLE B-21. Estimates of minimum inriver run size, catch, and escapement in thousands of adult coho entering the Columbia River ..... 215

## LIST OF TABLES (continued)

Page
TABLE B-22. Estimated catch and effort in the Buoy 10 fishery ..... 216
TABLE B-23. Willapa Bay fall Chinook terminal run size, catch, and spawning escapement in numbers of fish ..... 217
TABLE B-24. Willapa Bay coho terminal run size, catch, and spawning escapement in numbers of fish ..... 218
TABLE B-25. Grays Harbor Chinook terminal catch, spawning escapement, and run size in numbers of fish ..... 219
TABLE B-26. Grays Harbor coho terminal catch, spawning escapement, and run size estimates in numbers of fish ..... 221
TABLE B-27. Treaty Indian gillnet catch of Chinook, chum, and sockeye salmon in the Quinault River in numbers of fish ..... 222
TABLE B-28. Estimated inriver run size, catch and escapement for Quinault River coho in numbers of fish ..... 223
TABLE B-29. Estimated inriver run size, catch, and escapement of Queets River spring/summer Chinook in numbers of fish ..... 224
TABLE B-30. Estimated inriver run size, catch, and escapement of Queets River fall Chinook in numbers of fish ..... 225
TABLE B-31. Estimated terminal run size, catch, and escapement for Queets River coho in numbers of fish ..... 226
TABLE B-32. Estimated inriver run size, catch, and escapement for Hoh River spring/summer Chinook in numbers of fish. ..... 227
TABLE B-33. Estimated inriver run size, catch, and escapement for Hoh River fall Chinook in numbers of fish ..... 228
TABLE B-34. Estimated inriver run size, catch, and escapement for Hoh River coho in numbers of fish ..... 229
TABLE B-35. Estimated inriver run size, catch, and escapement for Quillayute River spring/summer Chinook in numbers of fish. ..... 230
TABLE B-36. Estimated inriver run size, catch, and escapement for Quillayute River fall Chinook in numbers of fish ..... 231
TABLE B-37. Estimated inriver run size, catch, and escapement for Quillayute River coho stocks in numbers of fish ..... 232
TABLE B-38. Puget Sound commercial net and troll fishery salmon catches in numbers of fish. ..... 234
TABLE B-39. Summary of Puget Sound marine recreational salmon catch estimates in numbers of fish from catch record cards ..... 236
TABLE B-40. Puget Sound reported commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound Chinook stocks ..... 237
TABLE B-41. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound coho stocks ..... 241
TABLE B-42. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks.a/ (Page 1 of 4) ..... 245
TABLE B-43. Puget Sound spring Chinook spawning escapement estimates in numbers of adult fish. ..... 249

a/ Most estimates based on carcass surveys with a jack length cut-off. In 2004, CDFG reviewed and updated 1971-2003 escapement estimates to reflect final project reports.
b/ Upper Sacramento mainstem estimates generally based on carcass surveys with a jack length cut-off, however jack estimates from Red Bluff Diversion Dam (RBDD) reports have occasionally been used. Early (pre-2001) mainstem Sacramento River adult and jack estimates based on RBDD passage.
c/ Upper Sacramento River escapement since 1990 includes Sacramento River mainstem, Battle Creek, and Clear Creek; escapement from Mill, Deer, and Butte creeks are included when surveys were conducted. Specific escapement estimates by tributary can be found at www.calfish.org.
d/ Survey methodology was variable; may not be comparable to other surveys.
e/ Change in estimation methodology due to extremely high Battle Creek escapement.
$f /$ Preliminary.

a/ In 2004, CDFG reviewed and updated 1971-2003 adult and jack spawner escapements based on final project reports.
b/ Chinook spawning during the fall; may include spring run fish.
c/ Nimbus Hatchery adult and jack counts include fish taken at Nimbus Weir, 1979-current.
d/ Total adults in Sacramento Hatcheries include Tehama-Colusa Fish Facility escapements, 1971-1985.
e/ Preliminary.
f/ Current hatchery-specific goals, not PFMC goals.

a/ Estimated number of jacks and adults based on sampling at Red Bluff Diversion Dam (RBDD) from unpublished CDFG data. Beginning in 1987 for late-fall and winter runs, estimates have been based on historical run patterns and partial counts at RBDD due to raising of dam gates during the last part of the late-fall run and first part of the winter run.
b/ Since 1998, late-fall adult and jack estimates are based on carcass counts of natural spawners plus fish spawned at Coleman Hatchery.
c/ Variable numbers of late-fall and winter run are trapped at Keswick Dam and spawned at Coleman or Livingston Stone Hatcheries.
d/ RBDD and carcass survey estimates represent alternative methods for determining winter run Chinook escapement.
e/ Natural spawning spring run which are isolated from fall run; primarily Mill Creek, Deer Creek, and Butte Creek escapement.
$\mathrm{f} /$ Sacramento River spring run estimates are the total RBDD counts minus the spring run numbers in the upper Sacramento tributaries. If this number is less than or equal to zero, then upper Sacramento River spring run estimates are zero.
g/ Feather River spring run estimates are primarily fish returning to Feather River Hatchery. Spring run are not distinguished from fall run in the natural spawning surveys and are reported in the fall run natural escapement numbers.
$\mathrm{h} /$ Jack proportion could not be determined.
i/ Primarily number of fish spawned at Coleman Hatchery 1991-1997. No data are available for natural spawners, as RBDD gates were raised during the time coinciding with the late-fall run.
j/ Methodology change from using snorkel survey to carcass survey for Butte Creek spring run estimates.
$\mathrm{k} /$ Methodology change for distinguishing spring run Chinook at Feather River Hatchery was implemented in 2005. Fish arriving at the hatchery prior to the spring Chinook spawning period were tagged and returned to the river. The spring Chinook escapement estimate is the number of these tagged fish that subsequently returned to the hatchery during the spring Chinook spawning period.
I/ Preliminary.
$\mathrm{m} /$ RBDD did not go into operation until June 15th, 2009, a month later than normal; thus RBDD winter and spring run estimates are unavailable for 2009.

a/ Total inriver run includes an estimated 30,550 fish that died prior to spawning in September 2002.
b/ Preliminary.
c/ In 2008 and 2009, fisheries were managed for a natural area spawning escapement of 40,700 adults

a/ From 1930-1937, 1957-1987 and 1991-1995, Shasta counts were made near the river mouth. From 1938-1955, they were made 6.5 miles upstream from the mouth; considerable spawning occurred downstream from the racks in these years. From 1988-1990, escapements were estimated from mark-recapture data (spawning surveys). 1991-2008 estimates were generated from weir counts.
b/ In 1991, estimates were generated from weir counts. In 1992-2007, estimates were generated from carcass surveys. In 2008, estimates were generated from a combination of video weir counts and carcass surveys
c/ In 2005 and 2007, redd counts were used in lieu of carcass surveys.
d/ Commercial fishing in lower Klamath River closed by the state after the 1933 season.
e/ Gillnetting resumed in lower 20 miles of Klamath River by Hoopa Valley Indian Reservation fishers in 1976.
f/ Shasta adults include Includes 276 females taken to Iron Gate Hatchery in 1981.
g/ Low water conditions appeared to hinder entry into the Shasta River in 1988.
h/ Preliminary.

a/ Survey frequency variable from year to year (between 1 and 10 surveys annually).
b/ Numbers reflect maximum annual counts of live fish and carcasses with adults and jacks combined. Counts are not shown in years where visibility is too poor to conduct surveys.
c/ Survey area was from mouth to falls (2 miles).
d/ Survey area was the mainstem and West Fork ( 4.5 miles).
e/ Total run size estimate including jacks and adults. Survey methodology changed in 2000-2001 to using index sites and subsequent estimates are not comparable to previous estimates.
$\mathrm{f} /$ Video counts of combined adults and jacks made at Mirabel Dam. Image quality is affected by turbidity.
$\mathrm{g} / \mathrm{Numbers}$ reported are redd counts. Olema Creek is excluded.
$\mathrm{h} /$ Low flows appeared to increase mainstem spawning and decrease tributary spawning for Cañon, Sprowl, and Tomki creeks.
i/ Cañon and Sproul creek totals exclude salmonids that were unidentifiable to species due to poor visibility or advanced decomposition.
j/ Preliminary data.
k/ Redd counts as of January 29, 2010

a/ Pistol River was subject to several "slope failures" in 1986 resulting in severe short-term alterations in gravel bars and spawning index areas. Considerable debris and siltation severely limited Chinook surveys resulting in " 0 " counts in Deep Creek index areas through December.
b/ Preliminary.

a/ Includes some upriver origin spring Chinook through 1980. Beginning in 1981, the lower river catch of lower river spring Chinook is based on mark recoveries rather than the
timing of the catch, as in previous years. Since 1986, GSI and VSI techniques have been used for stock composition analysis. Commercial catch includes Select Area fisheries. Sport catch is mainstem Columbia River, does not include tributaries. Catch may include small numbers of jacks. Sport fishery closed in 1995 to 1997.
b/ Prior to 1988, the escapement goal at Willamette Falls was 30,000 to 35,000 . Beginning in 1988, the goal was dependent on run size under the Willamette Basin Fish
Management Plan. Since 2001, hatchery escapement targets are set in the Fisheries Management and Evaluation Plan developed by ODFW. Lower Willamette sport catch may include small numbers of jacks.
c/ Includes hatchery escapement, tributary recreational catch, and natural spawning escapement for 1975 to present. The years 1971-1973 are based on using the 1975-1976 Cowlitz River recreational fishery adult harvest rates.
d/ Includes hatcheries operated by all agencies. Values are included in the totals for the tributary runs.
e/ Preliminary.

a/ Spring Chinook accounting ends on June 15. Chinook formerly managed separately as Snake River summer Chinook are now grouped with all upriver spring Chinook because of overlap in run timing. Snake River summer Chinook have been moved from Table B-14 to this table.
b/ Includes some lower river origin spring Chinook through 1980. Beginning in 1981, the lower river catch of upriver spring Chinook is based on mark recoveries rather than timing of the catch as in previous years. Since 1986, GSI techniques have been used for stock composition analysis. Commercial catch includes estimated miscellaneous fishery-related impacts from test fisheries, commercial shad fisheries, and Select Area commercial gillnet fisheries beginning in 1979 and catch and release mortalities from selective fisheries beginning in 2001. Sport catch includes mainstem fisheries between Buoy 10 and Bonneville Dam.
c/ Spring season fishery closed in 1975, 1976, and from 1978 to 2000. Spring Chinook landed during those years were from the winter season fishery.
d/ Bonneville Dam count minus Zone 6 mainstem commercial and ceremonial/subsistence treaty Indian harvest.
e/ Count at uppermost Snake River Dam (Little Goose in 1971-1974 and Lower Granite plus Tucannon wild escapement after 1974) plus harvest below Lower Granite Dam.
$\mathrm{f} /$ Rock Island Dam count.
g/Escapement of hatchery fish pass Lower Granite Dam and Priest Rapids Dam (Wenatchee, Entiat, and Methow)
h/ Preliminary

a/ Summer Chinook accounting begins on June 16. Chinook managed as Snake River summer Chinook prior to 2004 are now grouped with all upriver spring Chinook because of overlap in run timing. As of 2004, they have been moved from this table to Table B-13.
b/ Includes estimated miscellaneous fishery-related impacts from mainsetm recreational fisheries, test fisheries, commercial shad fisheries, and terminal area commercial gillnet fisheries beginning in 1979. Includes catch and release mortality in selective fisheries beginning in 2002.
c/ No directed commercial summer Chinook fishery from 1964 to 2003. Landings during those years are bycatch from commercial shad and sockeye fisheries.
d/ No directed commercial summer Chinook fishery from 1965 to 2003. Landings during those years are bycatch from commercial sockeye fishery.
e/ Bonneville Dam count minus Zone 6 mainstem sport, and treaty Indian commercial, and ceremonial/subsistence harvest.
f/ Priest Rapids Dam count.
$\mathrm{g} /$ Preliminary.
h/ Comanager goal established in 2004 associated with regrouping Snake River summer Chinook with Snake River spring Chinook.

a/ Based on Columbia River fall Chinook database, WDFW, unpublished. Does not include hatchery URB Chinook reared and released below McNary Dam.
b/ Includes tributary and mainstem catches between Bonneville and Priest Rapids dams.
c/ Includes Deschutes, Yakima, Upper Columbia, and Snake River escapements.
d/ Snake River wild; adjusted for stray hatchery fish. Includes wild fish hauled to Lyons Ferry Hatchery.
e/ Preliminary based on inseason run update.
f/ FMP goal. The U.S. v. Oregon parties managed for a McNary Dam escapement of 45,000 beginning in 1990 to account for increased hatchery brood stock needs and concern for the Snake River wild fall Chinook stock; 46,000 beginning in 1994 to account for the Hanford Reach sport fishery; 60,000 beginning in 2008 for increased production in the Snake basin. However, starting in 1994 inriver fisheries were managed primarily for ESA consultation standards.

TABLE B-19. Estimates of inriver run size, catch, and escapement in numbers of Columbia River adult mid-Columbia bright (MCB) stock fall Chinook destined for areas below McNary Dam, not including the Deschutes River. ${ }^{\text {al }}$

TABLE B-20. Estimates of minimum inriver run size and catch in numbers of adult spring, summer, and fall Chinook from the Columbia River. (Page 3 of 3 )
a/ For spring Chinook: includes lower and upper Willamette, Clackamas, Cowlitz, Kalama, Lewis, and Sandy Rivers. Sandy River harvest not available before 1990. Catch estimates may include small numbers of Jacks. For summer Chinook: all tributaries are closed. For fall Chinook: all tributaries downstream from Bonneville Dam.
b/ Includes Select Area catch
c/ Youngs Bay Select Area began in 1992. Tongue Point and Blind Slough began in 1998. Select Area test fisheries began in 1991. Other Select Areas include Knappa in Oregon and Deep River in Washington.
d/ Includes tributaries between Bonneville and McNary Dams, the Snake and Yakima rivers, Icicle and Ringold creeks.
e/ Primarily mainstem fisheries between Bonneville and McNary dams, but also includes fish caught in miscellaneous commercial Indian fisheries such as Klickitat dip net and mainstem fisheries upstream from McNary Dam.
f/ Primarily mainstem fisheries between Bonneville and McNary dams. Significant subsistence fisheries also occur in tributaries throughout the Columbia and Snake River basin, especially for spring Chinook, which are no included in these estimates
g/ Upriver spring Chinook accounting ends on June 15 and summer Chinook accounting begins on June 16
h/ Spring Chinook Buoy 10 area catch is included in mainstem sport.
i/ Preliminary. Fall Chinook estimates are from inseason run updates
j/ Summer Chinook retention was prohibited for all mainstem non-Indian and treaty Indian fisheries until 2003. Small non-Indian incidental mortalities prior to 2003 are associated with recreational Steelhead fisheries and commercial shad and Sockeye fisheries. A few stray summer Chinook are caught in Select Area (terminal) fisheries that are open for late returning spring Chinook and early returning fall Chinook. Prior to 2003, Treaty Indians could retain summer Chinook for subsistence purposes
k/ Fall Chinook minimum run size includes LRH, LRW, SCH, URB, MCB, and SAB

TABLE B-21. Estimates of minimum inriver run size, catch, and escapement in thousands of adult coho entering the Columbia River. ${ }^{\text {a }}$

a/ These numbers match OPI databases. Adjustments were made to the escapement figures and catches.
b/ Mainstem recreational catches listed in this table include tributary catches and catches in the Chinook/Hammond area of 3,195 in 1989, 28 in 1990, and 1,151 in 1991.
c/ Includes hatcheries operated by all agencies.
d/ Willamette Falls, Clackamas River (North Fork Dam) and Sandy River (Marmot Dam).
e/ Includes additional small adults counted as jacks for 1983-1984 and 1986-1989.
f/ Bonneville Dam count minus Zone 6 mainstem commercial treaty Indian harvest.
g/ Preliminary.

a/ Prior to 1982, Buoy 10 area catches were not estimated separately and are included in the Columbia River marine area (Cape Falcon to Washington. Effort and catch for the North Jetty fishery applied to the ocean quota for the Columbia River area until the ocean fishery closed Beginning in 2000, includes catch and effort from the Astoria-Megler Bridge upstream to the new boundary from Tongue Point, Oregon to Rocky Point, Washington.
b/ 1989 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 32 and 33 . A total of 7,922 angler trips produced catches of 492 Chinook, 3,195 coho, and a catch rate of 0.47 fish per trip. Catches in this fishery were counted against the Buoy 10 c/ 1990 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32 . A total of 3,225 angler trips produced catches of 54 Chinook, 28 coho, and a catch rate of 0.03 fish per trip.
d/ 1991 includes catch and effort data for the Chinook/Hammond fishery occurring during weeks 31 and 32 . A total of 2,759 angler trips produced catches of 39 Chinook, 1,151 coho, and a catch rate of 0.43 fish per trip.

a/ Non-local gillnet is catch in Area 2G prior to Aug. 16.
b/ Adults. Sport catch since 1991 includes marine areas within Willapa Bay (e.g., Washaway Beach).
c/ Escapement estimates after 1984 are based on revised spawning habitat estimates. Natural = adult returns assumed to be from natural origin parents.
d/ Does not include catch of non-local stocks.
e/ Preliminary.
f/ WDFW goal; not an FMP goal.

| GOAL |  |  |  |  |  | 14,600 |  |  |

a/ Age-3 and older.
b/ Age-3 and older, including hatchery fish spawning naturally.
c/ Includes naturally spawning fish taken for broodstock.
d/ Minimum estimate due to incomplete estimates of river recreational catch. Does not include non-local catch.
e/ Fewer than 50 fish.
f/ WDFW is not able to differentiate spawning time and believes this includes fall Chinook.
g/ Preliminary.
$\mathrm{h} /$ Recreational catch estimates by WDFW reflect application of catch record card bias correction factor of 0.833 . Quinault Indian Nation does not believe this factor is appropriate for this fishery. Unadjusted catch estimates are 1,000 for 1987; 2,400 for 1988; 2,500 for 1989; 2,400 for 1990; 4,500 for 1991; 2,600 for 1992; 4,200 for 1993; 4,300 for 1994; 6,500 for 1995; 6,800 for 1996; 3,400 for 1997; 3,500 for 1998; and 0.1 for 1999; terminal run sizes would be adjusted accordingly.

|  | GOAL |  |  |  |  | 35,400 |  |  |  |  |

a/ Beginning in 1987, estimates provided by WDFW for recreational catch reflect punch card bias correction factor.
b/ "Natural" includes hatchery fish spawning in wild. "Hatchery" includes wild fish taken for broodstock.
d/ The combined natural and hatchery run size total may not add to the sum of the catch and escapements due to hatchery total run size including on-station and off-station escapements.
e/ Preliminary.

a/ River catch of adults.
b/ Natural escapement includes hatchery strays
c/ Preliminary.
d/ Minimum. Terminal run managed at 30 percent exploitation rate of inriver run size.

TABLE B-30. Estimated inriver run size, catch, and escapement of Queets River fall Chinook in numbers of fish.

a/ River sport catch of age-3 and older fish. The 2000 sport fishery was closed to retention of unmarked Chinook. The 2002 sport fishery was closed to Chinook retention on October 18 due to unusually low water conditions. The 2008 sport fishery was closed to the retention of Chinook. The 2009 sport fishery was closed to retention of unmarked Chinook in Queets and Salmon Rivers within Olympic National Park.
b/ Includes Indicator Stock. Estimates for years prior to 2001 assume a broodstock take of 150 as a placeholder until individual run reconstructions are complete.
c/ Includes from 100 to 200 wild Chinook captured each season near spawning grounds to be used as Indicator broodstock
d/ This is an integrated wild/hatchery program. Broodstock are unmarked wild fish collected from river.
e/ Preliminary.
$\mathrm{f} /$ Minimum. Terminal run managed at 40 percent exploitation rate of terminal run size.

a/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch.
b/ River recreational catch of age-3 and older fish.
c/ Includes fish taken for hatchery brood stock and hatchery strays.
d/ Hatchery escapement and terminal run size exclude hatchery strays.
e/ Preliminary
f/ Terminal run size estimates incomplete since inriver sport catch estimates are unavailable.
$\mathrm{g} / \mathrm{Minimum}$. Terminal run managed at 40 percent harvest rate.

TABLE B-37. Estimated inriver run size, catch, and escapement for Quillayute River coho stocks in numbers of fish. (Page 2 of 2)

a/ Includes dip-in fish from other systems.
b/ Beginning in 2005, ceremonial and subsistence catch taken during scheduled gillnet fishery is reported as gillnet catch. Catch during designated
ceremonial and subsistence fisheries is listed seperately.
c/ Recreational catch of adults (coho over 20 inches).
d/ Natural escapement and run size estimates include fish taken for hatchery brood stock.
e/ Hatchery escapement and terminal run size exclude hatchery strays.
f/ Preliminary.
g/ Terminal run size estimates incomplete since inriver sport catch estimates are unavailable.
$\mathrm{h} /$ Regulations required nonretention of coho.

# TABLE B-41. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound coho stocks. ${ }^{2 /}$ 

(Page 4 of 4)
a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
b/ Includes estimated off-station returns.
c/ Terminal run size is defined as the run to terminal marine areas; spawning escapement plus sport and commercial net catch (inriver and terminal fishery catch). Prior to 1996 , estimates are Puget Sound run size, which is defined as the run available to Puget Sound net fisheries; spawning escapement plus commercial net catch (inriver, terminal, and preterminal Puget Sound net fishery catch), but not including fish caught in Puget Sound troll and recreational fisheries

TD TABLE B-42. Puget Sound commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound pink stocks. ${ }^{\text {a/ }}$
$\stackrel{\infty}{\stackrel{\infty}{\infty}} \quad$ (Page 4 of 4)
$\overline{\sum^{D}} \quad \mathrm{a} /$ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
$\sum_{0}$ b/ Includes estimated off-station returns.
$\xrightarrow[\sim]{\mathrm{N}}$ c/ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by
O troll and recreational fisheries inside Puget Sound.
$\bigcirc$ d/ Preliminary.
○ e/ Nisqually escapement estimate incomplete.
$\underset{\sim}{\mathcal{D}} \mathrm{f} /$ Large runs of pinks have returned to Green River in 2001, 2003, 2005, and 2007; however, no formal escapement methodology exists, and Green River pinks are not included
$\stackrel{\sim}{\sim}$ in the run reconstruction model. When the model is revised, pre-terminal catch estimates for all stocks will be affected.

| GOAL |  | 3,000 |  |  |  |  |  |

a/ Hatchery escapement estimates include all rack returns (retained and released)
b/ Natural escapement estimates based on carcass counts expanded by a 3.48 multiplier developed from 5 years of redd count based estimates. Most natural spawners are hatchery fish spawning in the wild.
c/ This estimate includes adult Chinook returns to Hupp Springs, White River Hatchery and to the Buckley Trap.
d/ Program has been discontinued
e/ Preliminary.

a/ Although the Skagit River escapement
b/ The Council management regime was not expected to meet equitable adjustment requirements for Skagit River coho.
c/ Plus 7,430 hooking mortality for pink fishery.
d/ Plus 3,250 hooking mortality for pink fishery.
e/ Hooking mortality of 2,800 coho for June 1-15 fishery not included.
f/ Plus 1,200 hook-and-release mortality for the Neah Bay all-salmon-except-coho fishery.
g/ Marked hatchery coho only (healed adipose fin clip). Except 2004 non-Indian troll Sept. 1-5 between Queets River and Cape Falcon, and sport Aug. 29-Sept. 6 between Queets River and Leadbetter Point.
h/ Sharing of impacts on ESA listed Puget Sound Chinook also affected the shaping of ocean and inside fisheries.
i/ For 2002, the Council elected to constrain fishing so that the OCN exploitation rate would not exceed 12.5 percent per ODFW's recommendation to provide additional protection for lower Columbia River natural coho, which are listed as endangered under the Oregon State-ESA. The FMP objective for OCN coho was 15 percent.

## GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES

Mar. 3 National Marine Fisheries Service (NMFS) provides the Council with a letter outlining the 2009 management guidance for stocks listed under the Endangered Species Act (ESA).

Mar. 10

Mar. 12

Mar. 17 North of Cape Falcon Salmon Forum meets in Lacey, Washington to initiate consideration of recommendations for treaty Indian and non-Indian salmon management options.

Mar. 30-31 Council holds public hearings on proposed 2009 management options in Westport, Washington, Coos Bay, Oregon, and Eureka, California.

Mar. 31 North of Cape Falcon Salmon Forum meets in Lynnwood, Washington to further consider recommendations for treaty Indian and non-Indian salmon management options.

Apr. 8 Council adopts final ocean salmon fishery management recommendations for approval and implementation by the U.S. Secretary of Commerce. The proposed measures comply with the salmon fishery management plan (FMP) and the current biological opinions for listed species.

May $5 \quad$ Ocean salmon seasons implemented as recommended by the Council and published in the Federal Register on May 5 (74 FR 20610), with an effective date of May 1.

July 16

July 31

Aug. 13
NMFS inseason conference number three for the U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery results in raising the landing and possession limit from 40 Chinook and 200 marked coho north of Leadbetter Point or 40 Chinook and 200 marked coho south of Leadbetter Point to 75 Chinook or 200 marked coho north of Leadbetter Point or 75 Chinook and 200 marked coho south of Leadbetter Point, per vessel per open period effective July 18.

NMFS inseason conference number four results in:

1) changing the bag limit to allow retention of two Chinook for the U.S./Canada border to Cape Falcon, recreational all-salmon fishery, effective August 1;
2) transfer of 2,900 Chinook remaining from the May-June U.S./Canada border Cape Falcon non-Indian commercial troll fishery quota to the all-salmon U.S./Canada border Cape Falcon non-Indian commercial troll fishery on an impact neutral basis, resulting in increasing the all-salmon fishery quota from 6,765 to 9,665 Chinook, effective August 1.

NMFS inseason conference number five for the U.S./Canada border to Leadbetter Point, recreational all-salmon fishery results in a transfer of 1,250 coho from the Neah Bay subarea coho quota and a transfer of 1,250 coho from the Westport subarea coho quota to the La Push subarea coho quota, resulting in new subarea coho quotas of 64,020 for Westport, 6,980 for La Push, and 17,100 for Neah Bay, effective August 14.

## GENERAL MANAGEMENT ACTIONS AND INSEASON CONFERENCES (continued)

Aug. 20 NMFS inseason conference number six results in a transfer of 8,750 coho from the Westport recreational subarea quota to the Columbia River recreational subarea coho quota on an impact neutral basis, resulting in increasing the Columbia River subarea quota by 8,300 coho from 88,200 to 96,500 coho, and decreasing the Westport subarea quota from 64,020 to 55,270 , effective August 21.

Aug. 26 NMFS inseason conference number seven for the U.S./Canada border to Cape Falcon, non-Indian recreational all-salmon fishery results in:

1) a transfer of 1,000 coho from the Neah Bay subarea coho quota to the La Push subarea coho quota, resulting in new sub area coho quotas of 7,980 for La Push, and 16,100 for Neah Bay, effective August 28;
2) closing the Columbia River subarea recreational fishery effective September 1 as the coho quota was approached.

Sept. 3 NMFS inseason conference number eight for the Cape Falcon to Humbug Mt. recreational and commercial coho fisheries results in:

1) transfer of 14,000 marked coho remaining from the June-August recreational fishery to the September recreational fishery on an impact neutral basis, resulting in increasing the September fishery quota by 2,560, from 7,000 marked coho to 9,560 marked coho, effective September 3;
2) transfer of 26,000 marked coho remaining from the June-August recreational fishery to the September commercial non-mark-selective fishery on an impact neutral basis, resulting in increasing the September commercial fishery quota by 10,240, from 11,000 coho to 21,240 coho, effective September 3.
And for the U.S./Canada border to Cape Falcon, non-Indian commercial and recreational allsalmon fisheries results in:
3) changing the commercial landing and possession limit from 75 Chinook and 200 marked coho north of Leadbetter Point or 75 Chinook and 200 marked coho south of Leadbetter Point to 75 Chinook and 100 marked coho north of Leadbetter Point or 75 Chinook and 100 marked coho south of Leadbetter Point, per vessel per open period effective September 3;
4) reopening of the recreational all-salmon fishery between Leadbetter Point and Cape Falcon effective September 7 through the earlier of September 30 or the 96,500 marked coho quota.

## NON-INDIAN COMMERCIAL TROLL SEASONS

May 1-June 30 U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery opens May 1-5, 8-12, then Saturday to Tuesday thereafter through June 30 with a 13,735 Chinook quota, and a landing and possession limit of 75 Chinook north of Leadbetter Point or 75 Chinook south of Leadbetter Point, per vessel per open period.

June 30 U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon-except-coho fishery closes as scheduled.

July 1- Sept. 15 U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery opens through the earlier of September 15 or quotas of 6,765 Chinook and 33,600 marked (adipose fin clipped) coho.

1) July 1-7, 11-14 with a landing and possession limit of 40 Chinook and 200 marked coho north of Leadbetter Point or 40 Chinook and 200 marked coho south of Leadbetter Point, per vessel per open period.
2) July 18 through September 1: Saturday to Tuesday, with a landing and possession limit of 75 Chinook and 200 marked coho north of Leadbetter Point or 75 Chinook and 200 marked coho south of Leadbetter Point, per vessel per open period.
3) September 5-8, 12-15 with a landing and possession limit of 75 Chinook and 100 marked coho north of Leadbetter Point or 75 Chinook and 100 marked coho south of Leadbetter Point, per vessel per open period.

## NON-INDIAN COMMERCIAL TROLL SEASONS (continued)

Sept. 1-30

Sept. 15

Sept. 30

Cape Falcon to Humbug Mt. non-Indian commercial all-salmon except Chinook fishery opens through the earlier of September 30 or a 21,240 non-mark selective coho quota.
U.S./Canada border to Cape Falcon, non-Indian commercial all-salmon fishery closes as scheduled.

Cape Falcon to Humbug Mt. non-Indian commercial all-salmon except Chinook fishery closes as scheduled.

## TREATY INDIAN COMMERCIAL TROLL SEASONS

May 1 All-salmon-except-coho fisheries open through the earlier of June 30 or a 19,000 Chinook quota.
June 30
July 1

Aug. 17 Makah all-salmon commercial fisheries close as coho quota is approached.
Aug. 18 Quinault all-salmon commercial fisheries close as coho quota is approached; Quileute and Hoh remain open.

Aug. 18-20 Makah all-salmon commercial fishery reopens with a landing and possession limit of 25 coho per vessel per open period.

Aug. 19-21 Quinault all-salmon commercial fishery reopens with landing and possession limit of 50 coho per vessel per open period.

Sept. 9-15 Makah and Quinault all-salmon commercial fishery reopens through September 15 with landing and possession limits of 5 coho per vessel per open period for Makah and 68 coho per vessel per open period for Quinault.

Sept. 15 All-salmon fisheries close as scheduled.

## RECREATIONAL SEASONS

June 20 Cape Falcon to OR/CA border, mark-selective coho fishery opens through the earlier of August 31, or a quota of 110,000 marked coho. Fishery is open seven days per week with a bag-limit of three fish per day north of Humbug Mt. or two fish per day south of Humbug Mt. Chinook non-retention except August 29-31 south of Humbug Mt.

June 27 U.S./Canada border to Cape Alava, all-salmon mark-selective coho fishery opens through the earlier of September 20 or a 16,100 marked coho quota ( 18,350 preseason minus transfers of 1,250 and 1,000 to La Push), with a 2,200 Chinook guideline. Fishery is open Tuesday to Saturday through July 17 and seven days per week thereafter. Bag-limit is two fish per day plus two additional pink salmon; only one Chinook per day prior to August 1 and no Chinook restriction thereafter. All coho must be marked with a healed adipose fin clip. No chum retention in August and September. No Chinook retention east of Bonilla-Tatoosh line beginning August 1.

Cape Alava to Queets River, all-salmon mark-selective coho fishery opens though the earlier of September 20 or a 7,980 marked coho quota ( 4,480 preseason plus transfers of 2,250 from Neah Bay and 1,250 from Westport), with a 950 Chinook guideline. Fishery is open Tuesday to Saturday through July 17 and seven days per week thereafter. Bag-limit is two fish per day plus two additional pink salmon; only one Chinook per day prior to August 1 and no Chinook restriction thereafter. All coho must be marked with a healed adipose fin clip.

TABLE C-9. Sequence of events in ocean salmon fishery management, 2009.a/ (Page 4 of 4)
RECREATIONAL SEASONS, (continued)
June 28 Queets River to Leadbetter Point, all-salmon mark-selective coho fishery opens though the earlier of September 20 or a 55,270 marked coho quota ( 65,270 preseason minus transfers of 1,250 to La Push and 8,750 to Columbia River), with a 11,850 Chinook guideline. Fishery is open Sunday to Thursday through July 23 and seven days per week thereafter. Bag-limit is two fish per day plus one additional pink salmon; only one Chinook per day prior to August 1 and no Chinook restriction thereafter. All coho must be marked with a healed adipose fin clip. Grays Harbor Control Zone closed beginning August 1.

Leadbetter Point to Cape Falcon, all-salmon mark-selective coho fishery opens though the earlier of September 30 or a 96,500 marked coho quota ( 88,200 preseason plus 8,300 transfer from Westport), with a 5,400 Chinook guideline. Fishery is open seven days per week. Bag-limit is two fish per day; only one Chinook per day prior to August 1 and no Chinook restriction thereafter. All coho must be marked with a healed adipose fin clip.

Aug. 29 Humbug Mt. to OR/CA border fishery opens through September 7. Fishery is open seven days per week. Bag-limit is two fish per day, all salmon through August 31, all salmon except coho thereafter. All coho must be marked with a healed adipose fin-clip.

OR/CA border to Horse Mt. all-salmon-except-coho fishery opens through September 7. Fishery is open seven days per week. Bag-limit is two fish per day.

Aug. 31 Cape Falcon to OR/CA border, all-salmon mark-selective coho fishery closes as scheduled.
Sept. 1 Leadbetter Point to Cape Falcon, all-salmon mark-selective coho fishery closes as the coho quota of 96,500 (post trade) is approached.

Cape Falcon to Humbug Mt. mark-selective coho fishery opens through the earlier of September 30 , or a quota of 9,560 ( 7,000 preseason plus 2,560 roll-over from June-August fishery) marked coho. Fishery is open seven days per week with a bag-limit of two fish per day; all salmon except Chinook, coho must be marked with a healed adipose fin clip.

Sept 7 Leadbetter Point to Cape Falcon, all-salmon mark-selective coho fishery reopens though the earlier of September 30 or the remainder of the 96,500 (post-trade) marked coho quota, and the 5,400 Chinook guideline.

Humbug Mt. to OR/CA border all-salmon-except-coho fishery closes.
OR/CA border to Horse Mt. all-salmon-except-coho fishery closes.
Sept. 20 U.S./Canada border to Cape Alava, all-salmon mark-selective coho fishery closes as scheduled.
Cape Alava to Queets River, all-salmon mark-selective coho fishery closes as scheduled.
Queets River to Leadbetter Point, all-salmon non-mark-selective fishery closes as scheduled.
Sep. 26 La Push area ( $48^{\circ} 00^{\prime} 00^{\prime \prime}$ N. Lat. to $47^{\circ} 50^{\prime} 00^{\prime \prime} \mathrm{N}$. Lat.), all-salmon mark-selective coho fishery opens through the earlier of October 11, a 100 Chinook quota or a 100 coho quota.

Sept 30 Leadbetter Point to Cape Falcon all-salmon mark-selective coho fishery closes as scheduled.
Cape Falcon to Humbug Mt. mark-selective coho fishery closes as scheduled.
Oct. 11 La Push area, all-salmon mark-selective coho fishery closes as scheduled.
a/ Unless stated otherwise, season openings or modifications of restrictions are effective at 0001 hours of the listed date. Closures are effective at 2359 hours of the listed date.

Page Left Intentionally Blank

## APPENDIX D HISTORICAL ECONOMIC DATA

## LIST OF TABLES

TABLE D-1. California monthly troll Chinook and coho average dressed weights (pounds) byPagearea of landing
TABLE D-2. Oregon monthly troll Chinook and coho average dressed weights (pounds) by area of landing. ..... 304
TABLE D-3. Washington monthly troll Chinook and coho salmon average dressed weights (pounds) ..... 305
TABLE D-4. California troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings ..... 306
TABLE D-5. Oregon troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings. ..... 307
TABLE D-6. Washington non-Indian troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings ..... 308
TABLE D-7. California salmon troll boat-size catch statistics in pounds of dressed salmon ..... 309
TABLE D-8. Oregon salmon troll boat-size catch statistics in pounds of dressed salmon ..... 313
TABLE D-9. Washington non-Indian salmon troll boat-size catch statistics in pounds of dressed salmon ..... 316
TABLE D-10. Preliminary California salmon landings (in pounds of dressed salmon) and exvessel values by vessel size categories and port from Crescent City to Morro Bay South, 2009 ..... 319
TABLE D-11. Preliminary 2009 Washington non-Indian troll salmon landings (in pounds of dressed salmon) and exvessel value by vessel size category and port area ..... 320
TABLE D-12. California number of vessels landing 50 percent and 90 percent of total pounds of salmon troll catch by year ..... 321
TABLE D-13. Oregon number of vessels landing 50 percent and 90 percent of total pounds of salmon troll catch by year ..... 322
TABLE D-14. Washington number of vessels landing 50 percent and 90 percent (by numbers of fish) of non-Indian troll salmon catch ..... 323
TABLE D-15. Preliminary 2009 California, Oregon, and Washington troll fleet by home state and salmon landings and exvessel value ..... 324
TABLE D-16. Vessels landing salmon in California by vessel length and skipper's state of residence ..... 325
TABLE D-17. Percentages of vessels landing troll salmon in Oregon by license holder's state of residence ..... 326
TABLE D-18. Percentages of vessels landing non-Indian troll salmon in Washington by license holder's state of residence ..... 327
TABLE D-19. Number of California charter boats participating in the ocean recreational salmon fishery, by port area and activity level ..... 328
TABLE D-20. Number of charter boats licensed in Oregon ..... 329
TABLE D-21. Number of salmon charter boats licensed in Washington (including Puget Sound) ..... 330
TABLE D-22. Price index ..... 331

a/ All values in this table are based on preliminary information available at the start of each year's review. Treaty Indian statistics include landings from Puget Sound.
b/ Season totals include additional winter treaty Indian troll.
c/ In 1994-1996 the non-Indian fishery for Chinook was closed north of Cape Falcon, however, Chinook were caught off Oregon and landed in Washington.

TABLE D-4. California troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings. ${ }^{\text {a }}$

a/ Derived from vessel registrations and fish landing tickets.
b/ In 1980, the establishment of a restricted vessel permit system drew a number of historically active vessels back into the fishery.
c/ In 1984, vessels were not required to land at least one salmon to be eligible for a permit in 1985. The Oregon Fish and Wildlife Commission waived this requirement because of the elimination of the coho fishery south of Cape Falcon.
d/ In 1985, vessels traditionally landing salmon south of Cape Blanco and north of Cape Falcon were not required to land at least one salmon to be eligible for a permit in 1986. The Oregon Fish and Wildlife Commission waived this requirement because of the complete closure of the coho season south of Cape Blanco and a limited one-day coho season between the Columbia River and Falcon.
e/ During the 1991 session of the Oregon Legislature, legislation passed waiving the requirement that troll permit holders must buy a 1991 permit to be able to renew for 1992. This was a one-time exemption for 1991 only.
$\mathrm{f} /$ Permits were reissued in a lottery, because the total number of permits had fallen below 1,200.

TABLE D-6. Washington non-Indian troll combined Chinook and coho salmon landings in dressed weight, value of landings and number of registered vessels making commercial salmon landings. ${ }^{\text {al }}$

a/ Derived from vessel registrations and fish landing tickets. All values in this table are based on preliminary information available at the start of each year's salmon review.
b/ 312 licenses and delivery permits purchased by buyback program.
c/ 118 licenses and delivery permits purchased by buyback program.
d/ The season was closed north of Cape Falcon, but Chinook were caught off Oregon and landed in Puget Sound.
e/ Value information is not provided in order to preserve confidentiality.
f/ Vessels were not required to purchase a permit in 1994 to maintain their eligibility for a permit in 1995.
$\mathrm{g} / 190$ licenses and delivery permits purchased by buyback program.
h/ 72 licenses and delivery permits purchased by buyback program at the end of 1996 and early 1997.
i/ 100 licenses and delivery permits purchased by buyback program at the end of 1997 and early 1998.
j/ 41 licenses purchased by buyback program at the end of 2000.

a/ Derived from vessel registrations and fish landing tickets.
b/ Number of boats includes only those recording pounds greater than 0 .
c/ Excludes pink salmon landings.
d/ Preliminary.

a/ All values in this table are based on preliminary information available at the start of each year's review.
b/ Excludes pink salmon landings.
c/ Number of boats includes only those recording pounds greater than 0 .
d/ The fishery was closed north of Cape Falcon, however, Chinook were caught off Oregon and landed in Puget Sound.

a/ Preliminary.
b/ Total pounds and exvessel values reported in this table may be less than are reported in other tables of the Review. The differences are generally one percent or less and likely related to vessel information missing for certain landings.
c/ Fewer than three vessels. Values combined with next category below to preserve confidentiality.
d/ Landed on the coast and transported to Puget Sound for processing.

a/ Includes licensed (permitted for 1980 on) and properly identified vessels only. Total poundage on which the numbers are based is not equal to total aggregate troll landings because of landings by unlicensed or misidentified vessels. Percentages of total pounds not credited to licensed (permitted) vessels were: 1974-19 percent, 1975-19 percent, 1976-9.4 percent, 1977-8 percent, 1978-1.4 percent, 1979-0.2 percent, 1980-1.7 percent, 1981-0.11 percent, 1982-2002-less than 0.05 percent, $2003-0.06$ percent, $2004-0.15$ percent, $2005-0.32$ percent, 2006-0.08 percent, 2007-0.7 percent, and 2008-0.05 percent.
b/ Preliminary.

a/ "Home state" refers to the declared state of residence of vessel skipper, who, in most cases, is also the vessel owner.
b/ Includes vessels with home states other than California, Oregon, and Washington.
c/ Includes vessels of unknown lengths.
d/ Length category for 1982 is $\geq 36$.
e/ Preliminary.

a/ Legislation that created the license requirement expired in 1987. Annual license fees were between $\$ 25$ and $\$ 100$ from $1980-$ 1987. The license requirement was reinstituted by rule in 1988 and 1989 with a $\$ 10$ fee.
b/ In 1990, responsibility for licensing of charter vessels was transferred to the Marine Board and fees for Oregon residents were increased from \$10 to between \$50 and \$100.

[^1]b/ Preliminary estimate of annual change based on the second and third quarters of the year.

Marine Fisheries Management Zones

[^0]:    D TABLE B-40. Puget Sound reported commercial net fishery catches and spawning escapements in numbers of fish for hatchery and natural Puget Sound Chinook stocks. ${ }^{\text {a }}$
    $\stackrel{(1}{2}$ (Page 4 of 4)
    $\underset{\sum}{\text { D. }}$ a/ Includes treaty Indian and non-Indian net commercial catches during the adult accounting period. Source: Puget Sound run reconstruction model.
    $\sum_{0}$ b/ Includes estimated off-station returns.
    $\xrightarrow[\sim]{\sim} \mathrm{c} /$ Puget Sound run size is defined as the run available to Puget Sound net fisheries; spawning escapement plus Puget Sound net fishery catch. Does not include fish caught by O troll and recreational fisheries inside Puget Sound.
    ${ }^{\circ} \mathrm{d} /$ Preliminary.
    O e/ Since 1999, numbers include Tulalip hatchery returns, which are not added into escapement since no broodstock is taken at the hatchery.

[^1]:    a/ Based on gross domestic product implicit price deflator.
