### **About the NOAA Technical Memorandum series**

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

SWFSC Technical Memorandums are available online at the following websites:

SWFSC: <https://swfsc-publications.fisheries.noaa.gov/>

NOAA Repository: <https://repository.library.noaa.gov/>

### **Accessibility information**

NOAA Fisheries Southwest Fisheries Science Center (SWFSC) is committed to making our publications and supporting electronic documents accessible to individuals of all abilities. The complexity of some of SWFSC's publications, information, data, and products may make access difficult for some. If you encounter material in this document that you cannot access or use, please contact us so that we may assist you.  
Phone: 858-546-7000

## Summary

The Marine Mammal Protection Act (MMPA) requires the National Marine Fisheries Service (NMFS) to document human-caused mortality, non-serious injury (NSI), and serious injury (SI) of marine mammals and to compare total mortality and serious injury (MSI) to potential biological removal (PBR) thresholds (Wade 1998) in marine mammal stock assessments. NMFS defines SI as “any injury that will likely result in mortality” (NMFS 2022). NMFS interprets the regulatory definition of serious injury as any injury that is more likely than not to result in mortality, or any injury that presents a greater than 50 percent chance of death to a marine mammal (NMFS 2022). The definition does not require that all such injured animals die, but rather requires only that the animal is more likely than not to die (NMFS 2022).

Excluding undetected or ‘cryptic mortality’ (Pace *et al.* 2021), documenting observed mortality is straightforward, while distinguishing NSI from SI requires data on injury severity and animal condition, often derived from opportunistic observations where complete assessment of injuries or fishing gear burdens is not possible. NMFS (2023) updated its SI designation and reporting process and policy directive, using guidance from previous SI workshops (Angliss and DeMaster 1998, Andersen *et al.* 2008), expert opinion, and analysis of additional injury cases. The procedural updates focus on pinnipeds and small cetaceans, however, NMFS is also exploring improvements to large whale injury assessments (Carretta and Henry 2022).

This report contains 2,072 cases of human-caused SI and NSI of marine mammals occurring in U.S. West Coast waters during 2018-2022 (Table 1, Appendix 1), for species included in the Pacific Marine Mammal Stock Assessments (SARs) (Carretta *et al.* 2023). Subsistence and directed takes, such as gray whales taken by Russian natives, are not included in this report, but are reported in published SARs. All data in this report and previously-published reports (*e.g.* Carretta *et al.* 2023) are available for download at Github as CSV files (see ‘Data Availability’ section).

Sources of injury and mortality data include stranding and disentanglement networks, public reports, commercial and recreational fishermen, researchers, and fishery observer programs. Records include observations of dead and injured marine mammals at sea and ashore attributed to anthropogenic sources. Injury sources include, but are not limited to, vessel strikes, gillnet entanglement, pot and trap gear entanglement, shootings, marine debris entanglement, research-related injuries/deaths, hook and line fishery interactions, and harassment by the public. Most records originate from observations in California, Oregon, and Washington, though a few Alaska records of Eastern North Pacific gray whales (*Eschrichtius robustus*) and northern elephant seal (*Mirounga angustirostris*) are included, because these species are assessed in the Pacific region SARs. Other marine mammals, such as Steller sea lions (*Eumetopias jubatus*), that occur in California, Oregon, and Washington waters are assessed in Alaska region SARs (Young *et al.* 2023) and are included in injury reports produced by the Alaska region (Freed *et al.* 2023). Two stocks of northern fur seal (*Callorhinus ursinus*) overlap in U.S. West Coast waters seasonally from December through May, the Eastern North Pacific stock (assessed in Alaska region SARs) and the California stock (assessed in Pacific region SARs) and interactions that occur in U.S. West Coast waters

during that time period are assigned to both stocks. Injury determinations for Pacific region species/stocks in the central Pacific from Hawaii westward are included in separate reports ([Bradford 2023](#), [Bradford and Lyman 2023](#)).

## Methods

Assessment of marine mammals for evidence of human-related injury or death (other than direct observations) may require application of systematic forensic protocols, combined with expertise in diagnosing trauma ([Moore \*et al.\* 2013](#)). Stranding network personnel may have varying regional standards for assessing causes of death and injury and thorough examination of carcasses or injured animals is not always possible. With respect to the uncertainties in determining whether injuries or deaths are human-related, we reviewed stranding records and at-sea sightings from U.S. West Coast, Pacific Islands, Mexico, and Alaska regions that involved anthropogenic sources originating in U.S. waters (*e.g.* whale entanglements detected in Mexico waters involving U.S. fisheries would be included in this report). Records with human-related causes of injury were evaluated using separate SI/NSI criteria for three broad taxonomic categories (pinnipeds, large whales, and small cetaceans) detailed in [NMFS \(2023\)](#). Animals whose initial reporting condition was 'dead' were not evaluated for SI/NSI, but are also included in tabular summaries of this report and in Appendix 1.

Injury determinations (excluding 1,517 records where an animal's initial condition was 'dead') include 555 injury records from 2018-2022 (Tables 2a-c). Both initial and final injury determinations are given for each record. For example, a pinniped entangled in gillnet that is constricting or impeding movement is considered seriously injured. This animal may be captured, taken to a rehabilitation center, treated for injuries, and released back into the wild without serious injuries. In the context of categorizing commercial fisheries based on total levels of MSI, for the NMFS List of Fisheries (LOF), this pinniped is considered seriously injured. This designation allows evaluation of fishery-specific risk to marine mammals, even though the pinniped was released back into the wild with non-serious injuries. In cases where injured pinnipeds are transferred to public display facilities (aquaria) or U.S. Navy marine mammal programs following treatment, because their survival in the wild is questionable, the final injury determination is termed 'captivity', as the animal is permanently removed from the wild population. This is equivalent to a SI for the purposes of evaluating injuries against PBR. Similar cases involve large whales entangled in fishing gear and subsequent disentanglement efforts. The whale's injuries may initially be considered serious, especially if the entanglement restricts movement. Successful disentanglement of all gear from a whale without lingering evidence of an entanglement-related health decline or SI may be designated as a NSI. For purposes of the LOF, initial injury assessments are used in evaluating individual fisheries. In the context of assessing SI and mortality against PBR levels, the final injury assessment or condition is used.

Takes reported by the Northwest Indian Fisheries Commission (NWIFC) lack details on animal condition. However, the interactions reported here occurred primarily in drift and set gillnet fisheries, gear types where survival of pinnipeds and small cetaceans is rarely-observed ([Carretta 2023](#)). In this report, we assume that reported NWIFC interactions represent serious injuries or deaths and thus, they are coded as 'DEAD' in this report. Serious

injuries and deaths both represent a MSI value = 1 (except for prorated SI of large whales, see below) that is counted against PBR in marine mammal stock assessments. Therefore, the coding of these cases as either 'SI' or 'DEAD' results in the same level of removals that is compared to PBR.

Most records involve a single anthropogenic source of injury or death, but animals may show signs of trauma from multiple sources. For example, pinnipeds entangled in gillnets may also have evidence of gunshot wounds. Where multiple sources of injury or death are reported, we attempt to identify the primary cause of death or injury in this report.

### Prorating of serious injuries (large whales only)

Large whales offer the opportunity to track outcomes of human-caused injuries, due to the ability to recognize individuals over time. In addition to 'NSI' and 'SI' categories, a third category of prorated serious injury ('SI prorated') is used for large whales. Prorated SI categories are determined from large whale records where the outcome of the injury is known, based on a review of historical large whale injury cases (NMFS 2023). For example, 25 vessel-strike cases involving large whales with known outcomes were reviewed and 13 (52%) resulted in a decline in health status or death of the animal (NMFS 2023). These data are used to inform decision-making on current vessel-strike lacerations where the severity of the laceration ('superficial' versus 'deep') is unknown and the vessel's size and speed are unknown. For these cases, SI is prorated by 0.52 to reflect the known outcomes of the 25 cases with vessel-strike lacerations. For cases with sufficient vessel-strike injury details, other SI codes are applied. If a vessel-strike laceration is superficial and does not extend below the blubber layer, this is considered a NSI. If the laceration extends below the blubber layer ('deep'), the whale is considered seriously injured (equivalent to a SI prorated value of 1.0). An example of calculating annual human-caused SI and mortality for large whales as part of the SAR process might include 10 documented vessel-strike lacerations of large whales of unknown severity, where the vessel's size and speed are unknown. Ten large whales with lacerations of unknown severity are counted as  $10 \times 0.52 = 5.2$  cases of SI. If one of these cases were confirmed as a deep laceration, then the calculation would be  $9 \times 0.52 = 4.7 + 1.0 = 5.7$  cases of SI.

A second form of MSI proration occurs in Pacific and Alaska marine mammal stock assessments for humpback whales (*Megaptera novaeangliae*) (Carretta *et al.* 2023, Young *et al.* 2023). Human-caused MSI of humpback whales in CA-OR-WA summer feeding areas includes whales from three stocks: *Central America / Southern Mexico - CA-OR-WA*, *Mainland Mexico - CA-OR-WA*, and *Hawai'i*. Where multiple stocks share a summer feeding area, total human-caused MSI for the mixed-stock area may be prorated to multiple stocks using point estimates of summer to winter area movement probabilities from Wade (2021). Because individual MSI cases cannot be assigned to a given stock, the 'Stock' listed for humpback whale cases in Appendix 1 of this document is generically called '*California - Oregon - Washington*' to reflect the summer feeding area.

## Number of cases vs MSI totals

In this report, we distinguish between the number of cases documented, versus the sum of total mortality and serious injury ( $\Sigma$ MSI) reported here and in marine mammal stock assessments. Using humpback whales as an example, the total number of cases assessed between 2018-2022 was  $n=119$ , whereas  $\Sigma$ MSI resulting from these cases was 91.5 (Table 1). The reader should note that human-caused MSI totals included in SARs may exceed totals summarized in this report. This is because SARs may include statistical estimates of undetected MSI from fisheries bycatch (Carretta 2023, Jannot *et al.* 2021), estimates of vessel strike mortality (Rockwood *et al.* 2017), proration of unidentified whale injuries to species (Carretta 2018), and corrected estimates of fishery-related stranding numbers from estimates of carcass recovery (Carretta *et al.* 2016b).

## Results

A total of 2,072 human-related injury ( $n=555$ ) and mortality ( $n=1,517$ ) records are summarized by species and broad taxa for the five-year period 2018-2022 (Tables 1-5, Appendix 1). Approximately 84% of all records represent opportunistic stranding reports and at-sea sightings, while the remaining 16% represent monitored sources, including fishery observer programs ( $n=195$ ), research-related activities ( $n=15$ ), and authorized removals of pinnipeds from Bonneville Dam and Willamette Falls under MMPA Section 120 ( $n=122$ ). Pinnipeds ( $n=1751$ ) were the most commonly documented injured or killed taxon due to human-related activities (Table 2a), followed by large whales ( $n=234$ ) (Table 2b) and small cetaceans ( $n=87$ ) (Table 2c).

Pinnipeds were most commonly injured or killed by gillnets and trawls, shootings, hook and line fisheries, authorized removals under MMPA Section 120, harassment, and marine debris (Table 3). Pinniped injury and mortality records included California sea lion (*Zalophus californianus*) ( $n=1,062$ ,  $\Sigma$ MSI=983), harbor seal (*Phoca vitulina*) ( $n=545$ ,  $\Sigma$ MSI=541), northern elephant seal ( $n=55$ ,  $\Sigma$ MSI=47), Guadalupe fur seal (*Arctocephalus townsendi*) ( $n=64$ ,  $\Sigma$ MSI=50), northern fur seal ( $n=7$ ,  $\Sigma$ MSI=6), unidentified sea lion ( $n=7$ ,  $\Sigma$ MSI=6), unidentified pinnipeds ( $n=5$ ,  $\Sigma$ MSI=3), unidentified fur seals ( $n=4$ ,  $\Sigma$ MSI=2), unidentified otariids ( $n=1$ ,  $\Sigma$ MSI=1), and unidentified seals ( $n=1$ ,  $\Sigma$ MSI=1) (Table 1). Many pinniped cases involve human intervention and treatment, either in the field or through capture and care at a rehabilitation facility. For those pinnipeds treated at rehabilitation facilities and subsequently released, it is assumed that they survived following treatment and their final injury assessments were NSI. An exception to this involves dependent pups that are released alone post-treatment, which are considered to be serious injuries. Pinniped records lacking details whether the animal was released following treatment are assumed to be seriously injured. Some pinnipeds were treated and released on site, and their final injury status was case-specific. A number of pinnipeds were euthanized due to their injuries ( $n=16$ ), while others were sent to public display facilities ( $n=2$ ) because their existing post-treatment condition made survival in the wild unlikely or they were individuals targeted for removal to protect endangered salmon. Of the 1,751 pinniped records, 1,356 animals died as a result of their injuries and an additional 282 cases were assigned as serious injuries, likely to result in death (Table 2a). Increasing numbers of pinniped strandings in recent years have

stretched the resources of rehabilitation facilities on the U.S. West Coast and have limited the ability to track the outcome of all cases.

Large whales were most often injured or killed by unidentified fisheries, vessel strikes, pot and trap fisheries, and gillnets (Table 4). Large whale injury and mortality cases included humpback whale (n=119,  $\sum$ MSI=91.5), gray whale (n=80,  $\sum$ MSI=67.31), fin whale (*Balaenoptera physalus*, n=9,  $\sum$ MSI=9), unidentified large whales (n=12,  $\sum$ MSI=7.33), blue whale (*Balaenoptera musculus*, n=5,  $\sum$ MSI=3.75), sperm whale (*Physeter macrocephalus*, n=4,  $\sum$ MSI=1) and minke whale (*Balaenoptera acutorostrata*, n=3,  $\sum$ MSI=1.75) (Table 1). Of the 234 large whale records of human-caused injuries and mortalities, 69 whales were initially reported as dead (8 later died from their injuries) and the remaining 157 were assessed for NSI/SI (Table 2b). The 77 large whale records involving dead animals were represented by vessel strikes (n=45), fishery-related entanglements (n=28), entanglement in marine debris (n=3), and illegal hunts (n=1). Of the 157 large whales evaluated for NSI/SI, fishery-related entanglements (n=143) were the most common cause of injury, followed by vessel strikes (n=12) and entanglement in marine debris (n=2). Approximately 32% of large whale injury cases (excluding whales initially detected dead) involved human intervention to remove gear. The relatively low percentage of rescue attempts reflects that many entangled whales are only seen once and that adverse weather conditions often prohibit safe disentanglement attempts. A total of 14 large whale records initially designated as SI resulted in a final injury status of NSI, the result of successful disentanglement efforts or the animal was able to free itself of gear (Table 2b).

A total of 87 small cetacean records were reviewed but were rarely assessed for SI (n=5) because most were initially reported as dead (n=82) (Table 2c). Mortality in gillnets, trawls (commercial and scientific trawls), and unidentified fisheries accounted for most cases, and 24 records were derived from systematic observer programs or monitored activities. Most records involved harbor porpoise (*Phocoena phocoena*) (n=29,  $\sum$ MSI=29), long-beaked common dolphin (*Delphinus delphis bairdii*) (n=30,  $\sum$ MSI=30), short-beaked common dolphin (*Delphinus delphis*) (n=17,  $\sum$ MSI=17), Pacific white-sided dolphin (*Lagenorhynchus obliquidens*) (n=5,  $\sum$ MSI=5), unidentified dolphin (n=1,  $\sum$ MSI=1), unidentified *Delphinus* (n=3,  $\sum$ MSI=2), striped dolphin (*Stenella coruleoalba*) (n=1,  $\sum$ MSI=1), and Dall's porpoise (*Phocoenoides dalli*) (n=1,  $\sum$ MSI=1). Research-related entanglements of small cetaceans in scientific trawls or nets accounted for 5 records, all were Pacific white-sided dolphins (*Lagenorhynchus obliquidens*).

## Discussion

Most records of human-related MSI represent opportunistic reports from strandings and at-sea sightings. Stranding data are considered minimum counts of human-related injury and mortality because not all carcasses come ashore or are detected, and not all human-related causes are recognized due to carcass decomposition. Where evaluated, estimates of recovery rates of cetacean carcasses are consistently low (<1% to 33%) across different regions and species, highlighting that observed numbers underestimate true impacts (Kraus *et al.* 2005, Williams *et al.* 2011, Pace *et al.* 2021, Prado *et al.* 2013), even for extremely coastal species (Wells *et al.* 2015, Carretta *et al.* 2016b). Not all human-related impacts are represented in this report, such as military sonars and other anthropogenic sound that may impact

cetaceans and the effects of which would be unknown unless affected animals stranded (Cox *et al.* 2006).

Variability in the assessment and determination of human-related injuries and mortality by responder or region is an unavoidable situation because regional data-recording standards may differ and the ability to examine animals may be compromised by weather or accessibility to carcasses (Moore *et al.* 2013). We have made an effort to review only records that have unequivocal or probable human-related impacts and recognize that some cases may be missed because of a failure to recognize human-caused injuries and deaths.

Some injuries and deaths attributed to marine debris may involve derelict fishing gear that cannot be positively-identified as fishery-related. In some cases, fishing gear may originate from outside of U.S. waters. Impacts of such gear or marine debris are likely to be greater than the number of observations, as this gear or marine debris may continue to entangle new animals over long time periods.

A small percentage of pinnipeds died after an initial injury assessment of NSI (Table 2a). Nearly all of these animals died during treatment in rehabilitation facilities, with hook-related injuries that appeared superficial (hooks in flippers and/or lip). Post-mortem examinations often reveal causes of death that are not reflected by the visible injuries. For example, California sea lions are sometimes found during necropsy to have bullets inside their bodies or fishing hooks in the esophagus/stomach.

## Data Availability

The data summarized in this report is available at [Github for download](#) as a CSV file.

Data from prior reports is [available here](#).

## Acknowledgments

Many of the records in this report were provided by those who devote their time to rescue and aid marine mammals in the wild. We would like to thank the fishery observers, academic researchers, disentanglement and stranding network personnel, vessel skippers, and members of the public for their reports on dead and injured marine mammals. Thanks to Allison Henry, Nancy Young, Amelia Brower, James Freed, and the Pacific Scientific Review Group for reviewing our serious injury cases.

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

Species	Stock	YYYY	MM	DD	Source	County	State	Initial	Narrative	Final	SI.Criteria	MSI.Value	LOF	PBR
BLUE WHALE	EASTERN NORTH PACIFIC	2018	6	16	VESSEL STRIKE	SAN FRANCISCO	CA	DEAD	NECROPSY: LARGE AREAS OF MUSCLE HEMORRHAGE ON THE LEFT AND RIGHT DORSO-LATERAL SIDES. HEMORRHAGED TISSUE OBSERVED CAUDAL TO THE GAPE ON THE LEFT SIDE. EXTENSIVE NECROTIC TISSUE WAS NOTED CAUDAL TO THE SKULL AT THE CERVICAL VERTEBRAE. BONE BRUISING WAS OBSERVED ON ALL OF THE RIBS THAT WERE VISUALIZED ON THE LEFT SIDE AND ON THE LEFT MANDIBLE. THERE WAS EXTENSIVE FREE-FLOWING BLOOD OBSERVED WHEN THE RIGHT THORAX WAS OPENED UP. THE FIRST THREE (3) LUMBAR VERTEBRAE WERE SURROUNDED BY NECROTIC TISSUE AND WERE SHATTERED INTO MANY PIECES, INCLUDING FRACTURED LATERAL PROCESSES, FRACTURED CENTRUMS, AND A FRACTURED EPIPHYSEAL PLATE. ALL OTHER VERTEBRAE THAT WERE VISUALIZED WERE INTACT. FINDINGS CONSISTENT WITH VESSEL STRIKE AS CAUSE OF DEATH.	DEAD	NA	1.00	N	Y
BLUE WHALE	EASTERN NORTH PACIFIC	2018	7	16	UNIDENTIFIED FISHERY INTERACTION	SONOMA	CA	SI (PRORATE)	WHALE TRAILING 2 YELLOW BUOYS APPROXIMATELY 40 FT. BEHIND ANIMAL. AMOUNT AND CONFIGURATION OF GEAR UNKNOWN.	SI (PRORATE)	L10	0.75	Y	Y
BLUE WHALE	EASTERN NORTH PACIFIC	2018	9	10	VESSEL STRIKE	VENTURA	CA	DEAD	ADVANCED DECOMPOSITION. ADULT MISSING A SUBSTANTIAL PORTION OF ITS LENGTH WITH THE MISSING FLUKE; LOCATED AN AREA THAT LOOKS TO BE A LARGE HEMATOMA JUST ADJACENT TO THE RIGHT PECTORAL FIN. THAT AREA WAS ON THE WATER SIDE OF THE ANIMAL SO WE WERENT ABLE TO SPEND TIME THERE. THE TERMINAL END OF THE PEDUNCLE LOOKED AS THOUGH THE FLUKES WERE SEVERED BY A LARGE PROPELLER, AS IT WAS A CLEAN SLICE, AND THERE WAS A "V" FLAP THAT WOULD BE CONSISTENT WITH A SPINNING PROPELLER.	DEAD	NA	1.00	N	Y
BLUE WHALE	EASTERN NORTH PACIFIC	2019	6	2	VESSEL STRIKE	LOS ANGELES	CA	DEAD	WHALE CAME IN ON THE BOW OF A CRUISE SHIP ENTERING LONG BEACH. VESSEL HAD LEFT MEXICO THE PREVIOUS NIGHT. LARGE AREA OF TRAUMA SURROUNDING A CREASE ON THE WHALES BACK JUST IN FRONT OF DORSAL FIN. CREASE WAS ALSO SURROUNDED BY BLUE PAINT. CREASE AND BLUE PAINT ARE LIKELY FROM ANIMAL BEING PINNED TO THE BOW OF THE SHIP. THERE IS HEMORRHAGING OBSERVED ON THE OPPOSITE SIDE OF THE BODY FROM WHERE THE CREASE WAS, IT IS BELIEVED THAT THE VESSEL COLLISION WAS ANTE-MORTEM. RIGHT PECTORAL FLIPPER BROKEN AT INSERTION AND JAWS WERE SEPARATED. BOTH OF THESE ARE BELIEVED TO BE POST-MORTEM.	DEAD	NA	1.00	N	Y
BLUE WHALE	EASTERN NORTH PACIFIC	2020	9	3	UNIDENTIFIED FISHERY INTERACTION	SANTA BARBARA	CA	NSI	BLUE WHALE WITH HEALING LINEAR SCAR POSTERIOR TO DORSAL FIN THAT APPEARS TO HAVE BEEN CAUSED BY LARGE DIAMETER ROPE OR OTHER ENTANGLING MATERIAL. THERE ARE ALSO RAW ABRASIONS THE LENGTH OF THE	NSI	L2	0.00	N	N

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

Species	Stock	YYYY	MM	DD	Source	County	State	Initial	Narrative	Final	SI.Criteria	MSI.Value	LOF	PBR
									CAUDAL PEDUNCLE AND ON THE ANTERIOR MARGIN OF THE DORSAL FIN, INDICATING THAT ENTANGLING MATERIAL SHIFTED TOWARDS THE BACK OF THE WHALE AT SOME POINT. ANOTHER, LARGER DIAMETER INDENTATION IS VISIBLE MID-BODY FROM UAV FOOTAGE, PRESUMABLY FROM THE SAME ENTANGLEMENT. WHALE WAS FREE-SWIMMING WITH NO GEAR ATTACHED, IN APPARENT GOOD HEALTH, DESPITE EVIDENCE OF A PREVIOUS CONSTRICTING ENTANGLEMENT. ASSIGNED NON-SERIOUS INJURY AS THE WHALE IS GEAR FREE AND IN APPARENT GOOD HEALTH. .

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

									TENDONS, AND THE CAUDAL VERTEBRAL BODY AND CONNECTED TO THE BODY BY A THICK BAND OF SKIN, BLUBBER, AND TENDONS ALONG THE RIGHT DORSAL AND LATERAL ASPECT. WOUND MARGINS ARE SHARP AND WELL-DEMARCATED. THE VERTEBRAL BONE ALONG THE CRANIAL ASPECT OF THE WOUND IS FRACTURED INTO NUMEROUS SMALL FRAGMENTS AND BONE ALONG THE CAUDAL ASPECT IS LARGELY INTACT WITH SEVERAL SMALL FRAGMENTS ALONG THE DORSAL AND LATERAL MARGINS OF THE BONE. THE CENTER OF THE VERTEBRAL BODY IS MOTTLED DARK RED TO PURPLE. ALONG THE DORSAL ASPECT OF THE FLUKE EXTENDING FROM THE LEFT LATERAL CRANIAL MARGIN DIAGONALLY TOWARDS THE RIGHT LATERAL CAUDAL MARGIN IS A 1.35 M, PARTIAL THICKNESS UP TO 3 CM DEEP LACERATION WITH EXPOSURE OF THE UNDERLYING BLUBBER AND CONNECTIVE TISSUE. THE RIGHT-SIDED, POST OCCIPITAL SUBCUTIS IS MARKEDLY EXPANDED WITH DARK RED, GELATINOUS MATERIAL (HEMORRHAGE). SKELETAL MUSCLE IS SIMILARLY HEMORRHAGIC. THE SUPERFICIAL BLUBBER IMMEDIATELY CAUDAL TO THIS IS BRIGHT RED (HEMORRHAGE).					
GRAY WHALE	EASTERN NORTH PACIFIC	2019	5	4	MARINE DEBRIS	SAN LUIS OBISPO	CA	SI (PRORATE)	WHALE DRAGGING A 2 FT X 2 FT STYROFOAM CUBE OR BUOY BEHIND BLOWHOLE. UNKNOWN AMOUNT OF LINE AND GEAR CONFIGURATION.	SI (PRORATE)	L10	0.75	N	Y
									THE PRELIMINARY CAUSE OF DEATH IS SEVERE ACUTE BLUNT TRAUMA AFFECTING THE HEAD AND NECK. POST-OCCIPITAL AND THORACIC EPAXIAL AND HYPAXIAL SKELETAL MUSCLES, PREDOMINANTLY ALONG THE RIGHT SIDE AND TO A LESSER DEGREE ON THE LEFT, ARE MARKEDLY EXPANDED WITH DARK RED GELATINOUS MATERIAL (HEMORRHAGE). THE OVERLYING DEEP BLUBBER AND SUBCUTIS ARE SIMILARLY HEMORRHAGIC AND THE SUPERFICIAL BLUBBER HAS A THICK LINEAR BAND OF HEMORRHAGE. ON CUT SURFACE, SKELETAL MUSCLE AND SUBCUTIS OOZES A MODERATE VOLUME OF RED-TINGED OPAQUE FLUID. THE TIPS OF THE DORSAL SPINOUS PROCESSES ON THE ATLAS (C2) ARE ABSENT AND THE EXPOSED ENDOSTEUM IS ROUGHENED AND IRREGULAR (AVULSION FRACTURE, PRESUMPTIVE). A LARGE RECTANGULAR PORTION OF THE PERIOSTEUM ALONG THE RIGHT NUCHAL CREST IS ELEVATED FROM THE UNDERLYING BONE AND THE EXPOSED SURFACE IS SIMILARLY ROUGH AND IRREGULAR (AVULSION FRACTURE, PRESUMPTIVE). A SMALL PORTION OF THE PERIOSTEUM ALONG THE DORSAL AND LATERAL ASPECTS OF THE RIGHT OCCIPITAL CONDYLE ARE SIMILARLY AVULSED. THE RIGHT SCAPULA HUMERAL AND RIGHT SQUAMOMANDIBULAR JOINTS WERE UNREMARKABLE.

GRAY WHALE	EASTERN NORTH PACIFIC	2020	5	10	UNIDENTIFIED FISHERY INTERACTION	PACIFIC	WA	DEAD	MODERATELY DECOMPOSED AND IN POOR NUTRITIONAL CONDITION WITH HEALING ENTANGLEMENT INJURY AT TIP OF LOWER JAW. ONE SET OF PHOTOS POSTED ON FACEBOOK ON MAY 10 SHOWED A LOOSE ENTANGLEMENT ON LEFT PECTORAL FLIPPER, BUT THE GEAR WAS GONE BY MORNING OF MAY 11. WHALE ALSO SHOWED EVIDENCE OF PRIOR ENTANGLEMENT.	DEAD	NA	1.00	Y	Y
GRAY WHALE	EASTERN NORTH PACIFIC	2020	5	31	VESSEL STRIKE	PACIFIC	WA	DEAD	BLUNT FORCE TRAUMA TO LEFT SIDE ROSTRUM. HEMORRHAGE, EDEMA, HEMATOMA, FORCE STRONG ENOUGH TO CAUSE LATITUDINAL CRACKS IN BALEEN AND BEND THE FRINGE OUTWARD OVER THE LOWER LIP. NO BROKEN BONES SEEN. AT LEAST CONTRIBUTED TO THE MORTALITY. HEALED ENTANGLEMENT WOUNDS ON LEADING EDGE OF FLUKES AND ON TAILSTOCK--NOT RELATED TO MORTALITY. INDENT ACROSS TONGUE (HEALED), APPROX 1/3 POSTERIOR TO THE TIP, APPEARS TO HAVE BEEN WRAPPED/CONSTRICTED AT SOME POINT--NOT RELATED TO MORTALITY. VESSEL SIZE AND SPEED UNKNOWN.	DEAD	NA	1.00	N	Y
GRAY WHALE	EASTERN NORTH PACIFIC - PCFG	2020	7	5	VESSEL STRIKE	GRAYS HARBOR	WA	DEAD	BLUNT FORCE TRAUMA TO TOP OF HEAD, PREMORTEM. HEMORRHAGE AND EDEMA AT TOP OF HEAD. BONE NEAR EAR CANAL CHIPPED, EVIDENCE OF DRAINING HEMORRHAGE IN AREA. TINY BONE FRAGMENTS COULD BE FELT IN EDEMATOUS BONE TISSUE. VESSEL SIZE AND SPEED UNKNOWN.	DEAD	NA	1.00	N	Y
GRAY WHALE	EASTERN NORTH PACIFIC - PCFG	2020	8	6	GILLNET FISHERY, TRIBAL	CLALLAM	WA	DEAD	TRIBAL SALMON GILLNET; NET AND ROPE THIS WHALE WAS REPORTED BY FISHERMAN (TRIBAL SALMON GILLNET FISHERY) THAT HAD CAUGHT THE WHALE IN HIS NET. IT WAS DEAD ON ARRIVAL AT 9:40 AM AFTER HAVING DROWNED IN THE NET. IT IS NOT KNOWN WHEN THE WHALE WAS ENTANGLED, OR WHEN IT DIED, BUT IT WAS CLEAR THAT THE WHALE HAD VERY LITTLE DECOMPOSITION SUGGESTING THAT IT HAD NOT BEEN DEAD IN THE NET FOR TOO LONG. CARCASS WAS BROUGHT ASHORE FOR A FULL EXAMINATION DUE TO THE ONGOING GRAY WHALE UME INVESTIGATION AND THE FRESH CONDITION OF THE ANIMAL. PRETTY CLEAR WHERE THE LARGE ROPES OF NET HAD INTERACTED WITH THE WHALE - BUT IF ROPE HAD NOT BEEN SEEN AT THAT LOCATION IT WOULD HAVE BEEN HARD TO PICK OUT AS COMPARED TO NORMAL SUITE OF SCARS AND SCRATCHES ON A GRAY WHALES. WE DID NOT SEE ANY OF THE CHARACTERISTIC HASH MARKING CAUSED BY A NET. ALSO INCLUDED IN NORTHWEST INDIAN FISHERIES COMMISSION ANNUAL REPORT.	DEAD	NA	1.00	N	Y

Appendix 1. Human-related mortality and injury cases reviewed for the 5-year period 2018-2022. Each case includes a field to indicate if it is counted against the NMFS List of Fisheries (LOF) (only commercial fisheries are included) and / or Potential Biological Removal (PBR) levels. The field 'COUNTY' represents the initial detection location, while 'STATE' incorporates additional information when known (an entanglement involving California Dungeness crab pot gear detected in Washington waters is coded as 'CA').

									PRESUMED FULL SELF RELEASE, SEEN GEAR FREE BY HAPPY WHALE IN NOVEMBER.					
HUMPBACK WHALE	CALIFORNIA - OREGON - WASHINGTON	2020	10	15	UNIDENTIFIED FISHERY INTERACTION	JEFFERSON	WA	DEAD	WHALE STRANDED ALIVE BUT DIED BY THE FOLLOWING MORNING. NECROPSY IDENTIFIED NUMEROUS SCRAPES, SCRATCHES, AND CIRCULAR OR OBLONG SKIN LESIONS WITH WIDE MARGINS AND DEPRESSED CENTERS. THE WHALE LICE (CYAMID) BURDEN WAS HEAVY ALONG THE BACK AND SIDES AND EXTENDING VENTRALLY ALONG THE HEAD AND MOUTH. DEEP CONSTRICTING WRAP INJURY ENCIRCLED THE TAILSTOCK WITH ASSOCIATED TISSUE NECROSIS AND ABRADED SKIN. SIMILAR ABRASIONS WERE ON THE RIGHT PECTORAL FIN, AND THE LEFT PECTORAL FIN APPEARED SWOLLEN. HEALED COOKIE CUTTER BITES WERE ON BOTH PECTORAL FINNS, AND A LARGE HEALED NOTCH WAS ON THE DISTAL END OF THE TRAILING LEFT PECTORAL FIN.	DEAD	NA	1.00	Y	Y
HUMPBACK WHALE	CALIFORNIA - OREGON - WASHINGTON	2021	1	28	CA SWORDFISH DRIFT GILLNET FISHERY	OFFSHORE	CA	SI (PRORATE)	WHALE ENTANGLED IN NET. CREW BEGAN RESCUE EFFORT BY CUTTING ROPE AND WEBBING AWAY FROM HEAD. ABOUT 15 FEET OF ROPE REMAINED ON LEFT PECTORAL FLIPPER AND A MODERATE SIZED CLUMP OF MESH AND A SINGLE BUOY AROUND THE CAUDAL PEDUNCLE. VESSEL DRIFTED AWAY FROM WHALE BEFORE ADDITIONAL GEAR COULD BE REMOVED. THE WHALE WAS SPOTTED 15 MINUTES LATER, SWIMMING SLOWLY AT THE SURFACE. THE BUOY WAS STILL VISIBLE ATTACHED TO THE WHALE. AMOUNT AND CONFIGURATION OF GEAR UNKNOWN.	SI (PRORATE)	L10	0.75	Y	Y
HUMPBACK WHALE	CALIFORNIA - OREGON - WASHINGTON	2021	4	3	UNIDENTIFIED FISHERY INTERACTION	VENTURA	CA	SI (PRORATE)	DARK/GREEN LINE OVER BACK IN FRONT OF DORSAL; BLUE AND WHITE BUOYS SEEN UNDERWATER. AMOUNT AND CONFIGURATION OF GEAR UNKNOWN.	SI (PRORATE)	L10	0.75	Y	Y
HUMPBACK WHALE	CALIFORNIA - OREGON - WASHINGTON	2021	4	9	UNIDENTIFIED FISHERY INTERACTION	HUMBOLDT	CA	SI (PRORATE)	OBSERVERS WITH SCOPES AT THE SCENE REPORTED TWO BUOYS WITH LINE WRAPPED AROUND THE MOUTH OF OF A WHALE, FULL SELF-DISENTANGLEMENT. ASSUMED GEAR-FREE.	NSI	L10	0.00	Y	N
HUMPBACK WHALE	CALIFORNIA - OREGON - WASHINGTON	2021	5	13	CA SPOT PRAWN TRAP FISHERY	SANTA BARBARA	CA	SI	WHALE (BASED ON PHOTOS AND VIDEO) SEEN WITH TRAILING LINE AND SINGLE BUOY, PROBABLY WRAPPED AROUND PEDUNCLE. WHALE INITIALLY DESCRIBED AS BEING IN SAME POSITION FOR TWO DAYS, SO ASSUMED IT WAS ANCHORED. FISHERY CONFIRMED VIA BUOY NUMBER AND CONTACT WITH OWNER. GEAR CONFIGURATION DESCRIBED AS 18 TRAPS, EACH WEIGHING 10 POUNDS, WITH 2400 FT OF GROUNDLINE. TRAPS ARE SPACED 100 FT APART. AN AUTHORIZED ENTANGLEMENT RESPONSE WAS INITIATED BUT TEAM STOOD DOWN AFTER CONTACT WITH FISHERMAN INDICATED WHALE WAS NOT ENTANGLED IN THE GEAR, THIS IS UNCONFIRMED.	SI	L2	1.00	Y	Y

UNIDENTIFIED WHALE	NA	2020	8	11	VESSEL STRIKE	LOS ANGELES	CA	DEAD	MV HORIZON PACIFIC (CONTAINER VESSEL) REPORTED THEY HAD STRUCK A WHALE IN POSITION 33-14N 119-12.3W. AT 0800T THE MV HORIZON PACIFIC UPDATED THAT THE WHALE HAS FALLEN OFF THE BULB OF THE SHIP IN POSITION 33-33-50N 118-25.50W. FRESH DEAD. VESSEL SIZE =247 FEET, CRUISING SPEED = 20 KTS (> 65 FT AND >10 KTS). SPEED IS ASSUMED, NOT KNOWN, BASED ON LOCATION OF REPORTED STRIKE AND VESSEL PROFILE LISTED AT VESSELFINDER.COM.	DEAD	NA	1.00	N	Y
UNIDENTIFIED WHALE	NA	2020	9	24	VESSEL STRIKE	HUMBOLDT	CA	SI (PRORATE)	REPORTING PARTY SAID HE STRUCK A WHALE. VESSEL WAS 25FT ASILMAR SOUNDER, TRAVELING 20-25 KTS. THE BOAT MADE CONTACT ON THE FORWARD PORT SIDE AND THE IMPACT THREW THE OPERATOR OUT OF THE SEAT AND THE PASSENGERS STATED THAT THE VESSEL CAME OUT OF THE WATER SEVERAL FEET DURING THE EVENT. HE DESCRIBED THE WHALE AS LARGE AND DARK GRAY OVER 30 FT BUT WAS UNCERTAIN OF SIZE AND SUSPECTED IT WAS POSSIBLY LARGER. THEY DID HEAR IT SURFACE BEHIND THEM AND TAKE SEVERAL BREATHS BUT DID NOT SEE IT OR ANY BLOOD IN THE WATER. BASED ON RP'S DESCRIPTION, SUBSTANTIAL IMPACT OCCURRED AT SIGNIFICANT SPEED. VESSEL SMALLER THAN WHALE.	SI (PRORATE)	L6B	0.20	N	Y
UNIDENTIFIED WHALE	NA	2021	6	29	VESSEL STRIKE	SAN DIEGO	CA	SI (PRORATE)	BLOOD SEEN IN WATER IN SHIP'S WAKE. CREW NOTICED HITTING AN OBJECT. BLOOD AND "PARTS OF BODY OF WHALE" WERE SEEN IN THE WAKE BY MULTIPLE CREW MEMBERS ON THE AFT END OF THE SHIP. FEW CREW (ONLY 1 FELT A "VIBRATE") INDICATED FEELING A SHUDDER AT TIME OF IMPACT. THERE IS NO INDICATION THAT THE SHIP HIT THE WHALE HEAD ON. MANY CREW MEMBERS BELIEVE THE WHALE SURFACED UNDER THE SHIP HITTING THE SHIP'S HULL. VESSEL SIZE AND SPEED UNKNOWN.	SI (PRORATE)	L11	0.52	N	Y
UNIDENTIFIED WHALE	NA	2021	7	11	VESSEL STRIKE	SAN DIEGO	CA	SI (PRORATE)	THREE LOOKOUTS QUALIFIED IN MARINE MAMMAL SIGHTING ON WATCH. STARBOARD LOOKOUT SIGHTED A WHALE CROSSING IMMEDIATELY UNDER THE BOW. THERE WAS INSUFFICIENT TIME FOR THE BRIDGE CREW TO MANEUVER AROUND THE WHALE. INTERNAL CREW SUBSEQUENTLY FELT THE AFT END OF THE SHIP SHUDDER. CREW OBSERVED A RED SLICK ON THE WATER APPROXIMATELY 600 YARDS ASTERN OF THE SHIP. VESSEL SIZE AND SPEED UNKNOWN.	SI (PRORATE)	L11	0.52	N	Y
UNIDENTIFIED WHALE	NA	2021	11	11	UNIDENTIFIED FISHERY INTERACTION	COOS	OR	SI (PRORATE)	WHITE BUOY WITH A BLACK BOTTOM THAT POPS UP CLOSE TO THE HEAD WHEN THE WHALE SURFACES THE BREATHE. GEAR CONFIGURATION AND AMOUNT UNKNOWN. POOR PHOTO.	SI (PRORATE)	L10	0.75	Y	Y
