NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

ABSTRACT

Two different sets of coastal upwelling index time series: (1) monthly upwelling indices, previously published for the period 1946-71, and (2) daily and weekly means of 6-hourly synoptic upwelling index computations, previously published for the period 1967-73, are updated through 1985 at locations off the western United States. Because of differences in the calculation procedures, the two sets are not numerically equivalent; i.e., monthly means of the daily values in set (2) are not equal to the corresponding monthly values in set (1). Thus the two series should not be intermingled in analysis procedures. Because of uncertainties concerning the longterm homogeneity of the data fields used for generating the series, long period variations (i.e., of the scale of decades and longer) should be regarded as suspect. The indices are most appropriately used to indicate relative fluctuations of upwelling intensity within groups of fairly contemporaneous years.

INTRODUCTION

The near-coastal regions of the major eastern boundary current systems of the world's oceans are characterized by vigorous coastal upwelling, high rates of primary production generally attributed to nutrient input to the illuminated surface layers by the upwelled waters, and particularly massive pelagic fish populations which feed low in the oceanic food web. The size of these pelagic stocks has fluctuated widely. A natural hypothesis is that interyear variability in upwelling intensity may be the cause of variability in the pelagic fish stocks and in other biotic components of the ecosystems.

Observations of upwelling rate are not available. Indications of coastal upwelling in the sea temperature distributions are qualitatively obvious but very difficult to quantify, particularly on longer time scales. Wooster and Reid (1963) demonstrated that the offshore directed surface Ekman transport constitutes an 'index of upwelling' that satisfactorily explains the seasonal variation in the near-coastal cooling attributed to upwelling. Bakun (1973) generated monthly estimates of offshore Ekman transport for the period 1946 to 1971. These were based on monthly mean analysed surface atmospheric pressure fields obtained from the U.S. Navy's Fleet Numerical Oceanography Center (FNOC), and utilized a simplified approximation to planetary boundary layer dynamics (15-degree anti-clockwise rotation and 30% contraction of the geostrophic wind vector). The resulting 'coastal upwelling indices' consequently avoid the problem of observing actual upwelling rates in the ocean by estimating the variation in the atmospheric forcing which drives the upwelling. No data from within the ocean itself are incorporated.

The conceptual model assumes that surface water transported away from the coast on large enough coastwise space scales, such that it cannot be readily replaced by horizontal surface flow, must be replaced by upwelling of deeper waters. Thus the model is valid only when averaged over fairly large space scales; this is accomplished by the atmospheric analysis procedures which are designed to suppress features of less than several hundred kilometers in extent. They also serve to 'spread' observational data which is irregularly distributed in time and space so as to fill data gaps in a meteorologically realistic manner and reduce inhomogeneities in the resulting time series (for further discussion of this aspect, see Bakun 1986). Use of monthly mean data was dictated by the varying frequencies of and origins of synoptic analyses available over the period previous to 1967. The computation procedure is nonlinear, and it was felt that making the computations on the synoptic data might introduce more serious time series inhomogeneities than if the computations were made after the higher frequency variability had been smoothed by monthly averaging.

These series have been updated routinely at Pacific Fisheries Environmental Group (PFEG) since Bakun's (1973) publication. They have been applied in a number of studies of environmental effects on fish stocks of the California Current system including northern anchovy (MacCall 1979), Pacific mackerel (Parrish and MacCall 1978), sardine (Bakun and Parrish 1980), Pacific hake (Bailey 1981), bonito (Collins and MacCall 1977), Dover sole (Hayman and Tyler 1980), rockfish (Bakun and Parrish 1980), coho salmon (Nickelson and Lechatowich 1984, McGie 1984), Dungeness crab (Peterson 1973, Botsford and Wickham 1975), and pink shrimp (Rothlisberg and Miller 1983). They have also been used in various studies of other biological and physical aspects of variability in the California Current ecosystem.

A second set of upwelling indices has been prepared for the period since 1967, when a consistent series of FNOC 6-hourly objectively analyzed synoptic wind/pressure analyses became available. These were intended to provide a useful description of the timing and intensity of shorter period upwelling and offshore surface transport fluctuations. Daily and weekly means of these series for the period 1967-73 were published by Bakun (1975).

Both sets of series were originally presented at 15 near-coastal intersections of a 3-degree latitude/longitude computation grid, arranged along the west coast of North America from 21N to 60N latitudes. In the present report, subsets of both are presented for the locations from 33N to 48N, updating each subset through 1985. Updates to the monthly upwelling index time series presented by Bakun (1973) are tabulated in Appendix A. Daily and weekly means of 6-hourly synoptic upwelling index computations, updating the series published by Bakun (1975) are presented in both numerical and graphical form in Appendix B. Details as to computational procedures, etc., can be found in the original publications.

CAVEATS

Because the 'monthly' upwelling indices are computed from monthly mean data, while the 'daily and weekly means' are averages of synoptic computations, the results are not numerically equivalent. This is the result of the nonlinear computation procedure whereby a computation from mean data produces an underestimate, the degree of which depends on the variance of the process during the month. To partially offset this underestimate, an artificially high drag coefficient is used in the computation of the monthly series. This results in average numerical parity near the area of 45N latitude. However, since the variance of the wind decreases to the south of

that point, the result is a tendency to produce an overestimate which reaches a maximum off Southern California and northern Baja California. This effect is discussed in detail by Bakun (1973). The conclusion is that series from different locations should not be used for spatial comparisons, and certainly that segments of the 'monthly' and of the 'daily and weekly mean' series should not be mixed together in any way.

Another source of spatial distortion in both sets of series arise from the fact that the scale of the analysis procedures does not resolve details of coastal topography which have important effects. For example, off Southern California the surface atmospheric pressure gradient is interrupted by the coastal mountain range; low barometric pressure in the hot central valley desert is thus actually separated from the area of higher barometric pressure over the cooler ocean by solid earth and rock. The result is that the real pressure gradient over the coastal ocean may be substantially less than that described by the analyzed large scale differences between pressures reported from central valley stations and pressures reported from coastal stations and ships at sea. The result is artificial amplification of values off Southern California compared to locations farther north (see Bakun 1973, 1975).

As mentioned by Bakun (1973), because of differences in the manner of analysis of earlier pressure fields in the monthly time series, and also because changes in station pattern over time, etc. might introduce artificial variations, long period variations (of decades and longer) should be regarded as suspect. Thus, attempting to correlate long-term trends or very long-period oscillations between these data and other time series is not recommended. Even aside from the concerns about possible long-term time series inhomogeneities, such longer period variations would represent too few real (i.e., independent) degrees of freedom to provide a basis for well founded empirical conclusions. In fact it will generally be necessary to remove long-period autocorrelation by filtering out long period variations both in the series presented here and in any other physical or biological series being analyzed with them, in order to avoid unacceptable reduction in available degrees of freedom. Assuming a separate degree of freedom for each data point in an autocorrelated time series is definitely an invalid procedure, a mistake often made in fisheries publications. One formula for estimating the appropriate reduction in degrees of freedom in autocorrelated time series is presented by Sutcliffe et al. (1976).

ACKNOWLEDGEMENT

Analyzed digital atmospheric pressure fields and access to computing and graphics facilities were provided by the U.S. Navy, Fleet Numerical Oceanography Center.

APPENDIX A**Tabulation of Monthly Coastal Upwelling Indices**

The following 3 pages display the monthly coastal upwelling indices for 6 near-coastal points over the period 1972-85. The first column indicates the year. The twelve columns to the right contain the monthly values computed from the respective monthly mean surface atmospheric pressure fields. These update the series presented by Bakun (1973).

The units are metric tons per second per 100 m of coastline. These units may be thought of as the average amount (metric tons or cubic meters) of water upwelled through the bottom of the Ekman layer each second along each 100 m of a straight line directed along the dominant trend of the coastline on a scale of about 200 miles. Because of uncertainties in some of the constants employed and for other reasons mentioned in this report and in Bakun (1973), it may be well to consider these indices as indicative of relative fluctuations at a location rather than as quantitative measures of absolute magnitude.

APPENDIX B**Tabulation of Daily and Weekly Upwelling Indices**

The following pages display daily and weekly means of 6-hourly upwelling index computations at 6 near-coastal locations over the period 1974-85. The display for each location occupies twelve consecutive pages, one page per year. These update the time series presented by Bakun (1975).

The left column indicates the calendar date of the Sunday which begins a particular week. The seven columns to the right contain the daily averages progressing from Sunday through the following Saturday. Each daily average summarizes the synoptic computations at 4 AM, 10 AM, 4 PM, and 10 PM Pacific Standard Time. The average of the seven daily mean values is listed in the right column of numbers.

The units are metric tons per second per 100 m of coastline. These units may be thought of as the average amount (metric tons or cubic meters) of water upwelled through the bottom of the Ekman layer each second along each 100 m of a straight line directed along the dominant trend of the coast on a scale of about 200 miles. Because of uncertainties in some of the constants employed and for other reasons outlined in this report and in Bakun (1973 & 1975), it may be well to consider these indices as indicative of short term relative fluctuations at a location rather than as quantitative measures of absolute magnitude.

To the right of each weekly row of numerical values, the daily values are plotted as horizontal lines, and the weekly means as vertical bars. Where a given value is so large that the plotted line would extend off the graph, truncation of the line is indicated by an "X".

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA TM-NMFS SWFC

 - 57 A budget simulation model for west coast albacore trollers.
S.F. HERRICK and K.L. CARLSON
(February 1986)
 - 58 The Hawaiian Monk Seal on Lisianski Island: 1983.
T.C. JOHANOS and A.K.H. KAM
(February 1986)
 - 59 Hawaiian Monk Seal observations and captive maintenance project at Kure Atoll, 1981.
W.G. GILMARTIN, R.J. MORROW, and A.M. HOUTMAN
(March 1986)
 - 60 Determining fish movements from an "archival" tag:
precision of geographical positions made from a time series of swimming temperature and depth.
P. SMITH and D. GOODMAN
(May 1986)
 - 61 The limitations of fish tracking systems: acoustic and satellite techniques.
I.G. PRIEDE
(May 1986)
 - 62 Procedures for sampling dolphins: A handbook for shipboard observers.
A.C. MYRICK, JR.
(July 1986)
 - 63 Sampling strategies for the Washington-Oregon-California sablefish fishery.
J.E. HIGHTOWER
(July 1986)
 - 64 Hawaiian monk seal reproduction and injuries on Lisianski Island, 1982.
T.C. JOHANOS and J.R. HENDERSON
(July 1986)
 - 65 The green turtle, *Chelonia mydas*, at Laysan Island, Lisianski Island, and Pearl and Hermes Reef, Summer 1982.
A.K.H. KAM
(August 1982)
 - 66 U.S. albacore trolling exploration conducted in the South Pacific during February-March, 1986.
R.M. LAURS
(August 1986)
