The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information. The TMs have not received complete formal review, editorial control, or detailed editing.

ABSTRACT

This report provides ichthyoplankton data and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) cruises conducted in the Southern California Bight region in 1987. It is the 27th report in a series that presents these data for all biological-oceanographic CalCOFI surveys from 1951 to the present. A total of 254 stations was occupied during quarterly cruises over the survey area which extended from Avila Beach to San Diego, California. Transects extended seaward in a southwesterly direction to a maximum of approximately 330 n. mi. The most seaward station, 90.0 120.0, was approximately 400 n. mi. west of Punta Baja, Baja California, Mexico. The data are listed in a series of four tables; the background, methodology, and information necessary for interpretation of the data are presented in an accompanying text. All pertinent station and tow data, including volumes of water strained and standard haul factors, are listed in the first table. Another table lists, by station and month, standardized counts of each of the 148 larval fish categories identified from survey samples. This series of reports makes the CalCOFI ichthyoplankton and station data available to all investigators and serves as a guide to the computer data base.

INTRODUCTION

This report, the 27th in the series, provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) joint biological-oceanographic survey cruises conducted in 1987. This program was initiated in 1949, under the sponsorship of the Marine Research Committee of the State of California, to study the population fluctuations of the Pacific sardine (*Sardinops sagax*) and the environmental factors that may play a role in these fluctuations. CalCOFI is a partnership among the Southwest Fisheries Science Center of the National Marine Fisheries Service (NMFS), the Scripps Institution of Oceanography (SIO), and the California Department of Fish and Game (CDFG). NMFS and SIO supply ships and personnel to conduct the sea surveys, NMFS processes the plankton samples and analyzes the ichthyoplankton from them. SIO processes and analyzes hydrographic and biological samples and analyzes invertebrate groups from the plankton samples.

The boundaries, station placement, and sampling frequency for the CalCOFI surveys were based on the results of joint biological-oceanographic cruises conducted by NMFS and SIO during 1939–1941. Originally, CalCOFI cruises were designed to collect sardine eggs and larvae and associated hydrographic data over the entire areal and seasonal spawning range of the species. From 1951 to 1960 the surveys were annual with cruises conducted monthly. The survey area was occupied quarterly during 1961–1965 and in 1966 the surveys became triennial with monthly cruises. Beginning in 1985 annual surveys were resumed, with quarterly cruises occupying only the Southern California Bight region (see Hewitt 1988 and Moser et al. 1993, 1994 for summaries of CalCOFI historical sampling effort).

Hydrographic and biological data from the 1987 CalCOFI survey have been published by the Scripps Institution of Oceanography (Univ. of Calif., SIO 1987, 1988). All available records for the 1987 CalCOFI surveys were verified and edited to produce this ichthyoplankton data report. These reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base. They are the basic documents against which changes in the data base can be compared as it is modified to correct errors and update earlier identifications. SAMPLING AREA AND PATTERN

A total of 254 standard CalCOFI survey stations was occupied on four cruises in 1987, employing two research vessels:

8703, RV *David Starr Jordan*, 62 stations, March 2-17;

8705, RV *David Starr Jordan*, 66 stations, April 30-May 14;

8709, RV *New Horizon*, 64 stations, September 4-19;

8711, RV *New Horizon*, 62 stations, November 13-28.

The survey area extended from Avila Beach to San Diego, California and seaward on six survey lines to approximately 120-330 n. mi. (Figures 1 and 2).¹ The most seaward station, 90.0 120.0, was approximately 400 n. mi. west of Punta Baja, Baja California, Mexico. Stations on CalCOFI lines 76.7 extended seaward to station 100.0 on cruises 8703 and 8705, to station 90.0 on 8709, and to station 80.0 on 8711. Stations on line 80.0 extended seaward to 100.0 on 8703 and 8705 and to 90.0 on 8709 and 8711. Stations on lines 83.3 and 86.7 extended to station 100.0 on 8703 and to 110.0 on all other cruises. On lines 90.0 and 93.3 stations extended seaward to station 120.0 on all cruises (Figures 1 and 2).

¹ Beginning in 1981 we changed our designation of ordinal survey lines (those ending in "3" and "7") to an exact decimal notation. Thus, lines 77, 83, 87, 93, etc. were changed to 76.7, 83.3, 86.7, 93.3, etc. to indicate the spacing between cardinal lines (those ending in "0"). Scripps Institution of Oceanography continues to use the original designation for ordinal lines (Figures 1 and 2 and see Univ. of Calif., SIO 1986a, b, 1987).

SAMPLING GEAR AND METHODS

In 1978, the standard 1-m ring net with towing bridle was replaced by a bridle-free "bongo" net. The bongo frame (McGowan and Brown 1966; Smith and Richardson 1977) consists of a pair of circular frames connected to a central axle. The axle is free to rotate so that the mouth openings are vertical during the tow. The standard CalCOFI net has 71 cm diameter frames and net material constructed of nylon mesh. Each net consists of a cylindrical section ~ 146 cm long, a truncated conical section ~ 161 cm long, and a detachable cod end. The starboard net, from which the standard sample is taken, is constructed of 0.505 mm mesh. The sample from the port side is used for other purposes; the mesh size is either 0.505 mm or 0.333 mm depending on requirements. The cod end of each net is constructed of 0.333 mm mesh.

The standard tow in 1987 was a double oblique haul to 210 m depth (to 15m from the bottom in shallow areas) designed to filter a constant amount of water per depth interval (~ 2 m³/m of depth) over the vertical range of most ichthyoplankters. Hauls were made at a ship speed of 1.5–2.0 knots and initiated by clamping the net to the towing cable above a 34 kg weight suspended below the surface. The net was lowered to ~ 210 m depth by paying out 300 m of wire at 50 m/minute (35 m of depth/minute). After fishing at depth for 30 seconds, the net was retrieved at 20 m/minute (14 m of depth/minute). The angle of stray was recorded every 30 seconds and maintained at 45° (± 3°) by adjusting ship speed and course. After reaching the surface, the nets were washed down and the samples preserved in 5% formalin buffered with sodium borate. At the beginning and end of each tow readings were made from a flow meter suspended in the mouth of the starboard net. Detailed descriptions of gear and methods are given by Kramer et al. (1972) and Smith and Richardson (1977); Ohman and Smith (1995) provided summaries of historical CalCOFI zooplankton methods and calibration factors for the various gear types.

LABORATORY PROCEDURES

We determined a zooplankton displacement volume for each sample (methods described in Staff, SPFI 1953 and Kramer et al. 1972). Samples containing > 25 ml of plankton were fractioned to ~ 50% of their original volume. Aliquot percentages for fractioned samples are listed in Table 1 under the "Percent Sorted" column. Sorting involved the removal of ichthyoplankton from the samples and identification and separation of: eggs and larvae of Pacific sardine, northern anchovy, and Pacific saury, and larvae of Pacific hake. Body lengths of sardine, anchovy, and hake larvae were measured to the nearest 0.5 mm.

A standard haul factor (SHF) was calculated for each tow to make them comparable and to allow estimation of areal abundance. The SHF is calculated by the formula:

$$SHF = \frac{10 D}{V}$$

where D = depth of haul = cosine of the average angle of stray of the towing cable multiplied by cable length (m)

V = total volume of water (m³) strained during the haul

$$V = R \cdot a \cdot p$$

where R = total number of revolutions of the current meter during the haul

a = area (m²) of the mouth of the net

p = length of the column of water needed produce one revolution of the current meter

Tow depth, volume of water strained, and standard haul factor are listed in Table 1 for each tow taken during 1987. Detailed descriptions of factors involved in calculating these values are presented in Ahlstrom (1948), Kramer et al. (1972), and Smith and Richardson (1977).

IDENTIFICATION

Identification of ichthyoplankton species beyond those separated during the sorting process was done by a separate group of specialists. Early ontogenetic stages of fishes are inherently difficult to identify and this is further complicated by the large number and diversity of species which contribute to the ichthyoplankton of the California Current region. Most identifications were accomplished by establishing ontogenetic series on the basis of morphology, meristics, and pigmentation, and then linking these series through overlapping features to known metamorphic, juvenile, or adult stages (Powles and Markle 1984). Our ability to identify larvae in the California Current region improved greatly during 1988–1995 as a result of an intensive research project aimed at producing a taxonomic monograph on the ontogenetic stages of fishes of this region (Moser 1996). Except for damaged specimens, most larvae in the 1988 surveys could be identified to species. A total of 148 larval fish categories (including unidentified and disintegrated) was identified for 1987: 121 to species, 17 to genus, 9 to family or subfamily, and 1 to suborder. Identifications were done in the Ichthyoplankton Ecology Laboratory of the Coastal Fisheries Resources Division by William Isham and Ernesto Calix of MEC Analytical Systems, working closely with larval fish identification experts in the laboratory who checked each sample.

With few exceptions, taxonomic categories above species represent small specimens which were damaged and partly disintegrated during capture. The following taxonomic categories in Tables 2–4 require special explanation:

Cyclothona spp. – small or damaged larvae, mostly *C. acclinidens* and/or *C. pseudopallida* lacking diagnostic characters.

Cyclothona acclinidens, *C. pseudopallida* – larger larvae (primarily postflexion stage) having diagnostic pigmentation characters.

Diaphus spp. – *Diaphus theta* is the dominant *Diaphus* species in the survey area and most, if not all, of the larvae from the Southern California Bight region are this species; the generic category is used because a small proportion of the *Diaphus* larvae captured at the outer margin of the survey pattern may represent other species whose larvae are identical to those of *D. theta*.

Disintegrated fish larvae – larvae that could not be identified because of their poor condition; separated from the "unidentified" category to monitor the general condition of the ichthyoplankton samples through the time series.

Glyptocephalus zachirus – see comment for Pleuronectidae

Howella spp. – larvae represent a single species, either *H. brodiei* or *H. sherborni*; taxonomy of the adult is unresolved.

Lampanyctus spp. – primarily small (< 5.0 mm) larvae of *L. ritteri* and *L. regalis*; Zahuranec (In Press) has placed 17 species of *Lampanyctus* with small or absent pectoral fins in the genus *Nannobrachium*; four of these species occur in the current CalCOFI survey area (*L. regalis*, *L. ritteri*, and two undescribed species designated here by the descriptive names *Lampanyctus* "no

pectors" and *Lampanyctus "niger"*).

Lyopsetta exilis – see comment for Pleuronectidae.

Microstoma spp. – larvae of a distinct but undescribed microstomatid species.

Neoclinus – *Neoclinus blanchardi*, *N. stephensae* and *N. uninotatus* occur in the area, but only the first two species have been identified in samples; larvae < 6 mm have not been identified to species.

Parophrys vetulus – see comment for Pleuronectidae.

Pleuronectidae – Sakamoto (1984) changed pleuronectid generic designations for species in the CalCOFI area as follows: 1) *Glyptocephalus zachirus* was changed to *Errex zachirus*; 2) *Isopsetta isolepis*, *Lepidopsetta bilineata*, and *Parophrys vetulus* were transferred into *Pleuronectes* and 3) *Lyopsetta exilis* was changed to *Eopsetta exilis*; although these changes were incorporated in the lists of Robins et al. (1991) and Eschmeyer (1998) we follow Nelson (1994) in retaining the older nomenclature because Sakamoto's (1984) changes were based on a phenetic study; also, the older names are used in the major identification guides to fishes of our region (Miller and Lea 1972, Eschmeyer et al. 1983, Matarese et al. 1989, and Moser 1996).

Sebastolobus spp. – larvae of this genus < 10 mm in length are not identifiable to species; larvae > 10 mm are identified as *S. alascanus* or *S. altivelis*.

Unidentified fish larvae – larvae that were generally in good condition but could not be identified because of their small size or early stage of development.

Vinciguerria lucetia – *V. lucetia*, an eastern tropical Pacific species, is common in the present CalCOFI region whereas the central water mass species *V. poweriae* is encountered rarely, usually only at the most seaward CalCOFI stations; a small percentage of *V. poweriae* larvae may have been included in the *V. lucetia* category because of the difficulty in separating early larvae which often are virtually identical.

SPECIES SUMMARY

Of the five most abundant larvae in 1987, the northern anchovy (*Engraulis mordax*) ranked first in abundance (74.0% of the total larvae) and first in occurrence with 48.0% positive tows (Tables 2 and 3). The Pacific hake (*Merluccius productus*) ranked second in abundance with 3.4% of the total larvae and eighth in occurrence (26.8% positive tows). The Panama lightfish (*Vinciguerria lucetia*) ranked third with 2.83% of the larvae and ranked eleventh in occurrence (24.8% of the tows). The myctophid *Stenobrachius leucopsarus* was the fourth most abundant taxon with 2.82% of the total larvae and ranked fourth in frequency of occurrence (36.6% of the samples). The rockfish genus *Sebastes* ranked fifth in abundance (2.6% of total larvae) and third in occurrence (37.8% of the samples). The next five most abundant taxa were the California smoothtongue *Leuroglossus stibius* (2.5% of the total larvae), the popeye blacksmelt *Bathylagus ochotensis* (1.2%), the Pacific mackerel (1.0%), the Pacific sardine *Sardinops sagax* (0.8%), and the Jack mackerel *Trachurus symmetricus* (0.7%). These species ranked 7th, 6th, 25th, 34th and 18th in frequency of occurrence, respectively. The 10 most abundant taxa comprised 91.7% of all the larvae collected on CalCOFI cruises in 1987. The remaining 8.3% was distributed among 138 other taxa (including the "disintegrated" and "unidentified" categories). Of the ten most abundant taxa, four are coastal pelagic species, four are midwater species, and two are coastal demersal taxa.

EXPLANATION OF TABLES

Table 1. This table lists for each tow the pertinent station and tow data, the volume of water filtered, the standard haul factor, the plankton volume, the percentage of sample sorted, and the total number of fish eggs and larvae. CalCOFI cruises are designated by four digits; the first two indicate the year and the second two the month. Within each cruise the data are listed in order of increasing line and station number (southerly and seaward directions); the order of station occupancy is shown on the station charts (Figures 1 and 2). Stations are designated by two groups of numbers; the first set indicates the line and decimal fraction and the second set indicates the station and decimal fraction. Time is listed as Pacific Standard Time at the start of each tow in 24-hour designation. Plankton displacement volumes were determined after removal of large organisms (those with individual displacement volumes > 5 ml) and expressed as ml per 1000 m³ of water filtered. The values for total fish eggs and larvae are raw counts (unadjusted for percent of sample sorted or standard haul factor). Ship codes are as follows: JD, *David Starr Jordan*; NH, *New Horizon*. The listings for station latitude and longitude in this table may differ from values given for the same station in the SIO data reports, reflecting the slight difference in position of the net tow and hydrocast. Dates given here and in Figures 1 and 2 for the beginning and end of each cruise are based on Pacific Standard time at the first and last net tow station of the cruise and do not include transit time from port to the first station and to port after the last station. Thus, our cruise dates may differ slightly from those in SIO reports which are based on GMT prior to 1990 and include transit time to the first station and from the last station.

Table 2. Pooled occurrences of all larval fish taxa taken on CalCOFI survey cruises in 1987 listed in rank order.

Table 3. Pooled counts of all larval fish taxa taken on CalCOFI survey cruises in 1987 listed in rank order. Numbers are adjusted for percent sorted and standard haul factors.

Table 4. Numbers of fish larvae for each taxon, listed by station and calendar month of the tow. Counts are adjusted for percentage of sample sorted and standard haul factor. The orders are listed in phylogenetic sequence (Eschmeyer 1998).

ACKNOWLEDGMENTS

The following NMFS personnel were responsible for making the collections at sea: Dimitry Abramenkoff (8705, 8709, 8711), David Ambrose (8703), Ronald Dotson (8703, 8705), William Flerx (all cruises), Susan Jacobson (8703), Cynthia Meyer (8703), and Susan Manion (8711). The samples were sorted by Lucy Dunn, Frances Pocinich, and Jean Haddox. William Isham and Ernesto Calix identified the samples in conjunction with the senior author and other personnel of the ichthyoplankton group (David Ambrose, Sharon Charter, William Watson). Amy Hays and Susan Manion entered the data and Susan Jacobson provided programming assistance. The cooperation and assistance provided by the crews of the CalCOFI research vessels were instrumental in making the collections and observations at sea.

<i>Lyopsetta exilis</i>	84
<i>Microstomus pacificus</i>	84
<i>Parophrys vetulus</i>	84
<i>Pleuronichthys verticalis</i>	85
Cynoglossidae	
<i>Sympodus atricaudus</i>	85
Unidentified fish larvae	85
Disintegrated fish larvae	85
Unidentified fish larvae	86

ALPHABETICAL INDEX TO TABLE 4

<i>Anoplarchus purpurescens</i>	77	<i>Gonichthys tenuiculus</i>	60
<i>Arctozenus risso</i>	48	<i>Hippoglossina stomata</i>	83
<i>Argentina sialis</i>	30	<i>Howella</i> spp.	74
<i>Argyropelecus affinis</i>	39	<i>Hygophum atratum</i>	60
<i>Argyropelecus hemigymnus</i>	40	<i>Hygophum reinhardtii</i>	60
<i>Argyropelecus lychnus</i>	40	<i>Hygophum</i> spp.	60
<i>Argyropelecus sladeni</i>	40	<i>Hypsoblennius gentilis</i>	78
<i>Argyropelecus</i> spp.	39	<i>Hypsoblennius jenkinsi</i>	78
<i>Aristostomias scintillans</i>	46	<i>Icelinus quadriseriatus</i>	73
<i>Artemidius creaseri</i>	73	<i>Icelinus</i> spp.	73
<i>Artemidius lateralis</i>	73	<i>Ichthyococcus irregularis</i>	42
<i>Atherinopsis californiensis</i>	67	<i>Icichthys lockingtoni</i>	79
<i>Bathophilus flemingi</i>	45	<i>Icosteus aerigmaticus</i>	78
<i>Bathyagonus pentacanthus</i>	74	<i>Idiacanthus antrostomus</i>	46
<i>Bathylagus milleri</i>	31	<i>Lampadена urophaos</i>	52
<i>Bathylagus ochotensis</i>	32	<i>Lampanyctus "niger"</i>	52
<i>Bathylagus pacificus</i>	33	<i>Lampanyctus "no pectorals"</i>	52
<i>Bathylagus wesethi</i>	34	<i>Lampanyctus regalis</i>	53
<i>Bathylagus</i> spp.	31	<i>Lampanyctus ritteri</i>	53
<i>Benthalbella dentata</i>	47	<i>Lampanyctus</i> spp.	52
<i>Brama japonica</i>	75	<i>Lampanyctus steinbecki</i>	54
<i>Brosmophycis marginata</i>	66	<i>Lepidogobius lepidus</i>	78
<i>Caristius maderensis</i>	75	<i>Lepidopsetta bilineata</i>	84
<i>Cataetyx rubrirostris</i>	66	<i>Leptocephalus giganteus</i>	28
<i>Ceratoscopelus townsendi</i>	50	<i>Lestidiops ringens</i>	49
<i>Chauliodus macouni</i>	44	<i>Lestidiops</i> spp.	48
<i>Chiasmodon niger</i>	77	<i>Leuroglossus stilbius</i>	35
<i>Chromis punctipinnis</i>	76	<i>Loweina rara</i>	60
<i>Citharichthys sordidus</i>	81	<i>Lyopsetta exilis</i>	84
<i>Citharichthys</i> spp.	81	<i>Lythrypnus dalli</i>	78
<i>Citharichthys stigmaeus</i>	82	<i>Magnisudis atlantica</i>	49
<i>Cololabis saira</i>	67	<i>Melamphaes lugubris</i>	67
<i>Coryphopterus nicholsii</i>	78	<i>Melamphaes parvus</i>	68
<i>Cryptotrema corallinum</i>	77	<i>Melamphaes simus</i>	68
<i>Cyclothona acclinidens</i>	37	<i>Melamphaes</i> spp.	67
<i>Cyclothona pseudopallida</i>	38	<i>Melanostomiinae</i>	45
<i>Cyclothona signata</i>	38	<i>Merluccius productus</i>	64
<i>Cyclothona</i> spp.	37	<i>Microstoma</i> spp.	30
<i>Danaphos oculatus</i>	41	<i>Microstomus pacificus</i>	84
<i>Diaphus</i> spp.	51	<i>Myctophidae</i>	49
<i>Diogenichthys atlanticus</i>	58	<i>Myctophum nitidulum</i>	60
Disintegrated fish larvae	85	<i>Nansenia candida</i>	31
<i>Electrona risso</i>	59	<i>Neoclarius stephensae</i>	77
<i>Engraulis mordax</i>	28	<i>Notolychnus valdiviae</i>	54
<i>Genyonemus lineatus</i>	75	<i>Notoscopelus resplendens</i>	55
<i>Gigantactis</i> spp.	66	<i>Oneirodes</i> spp.	66
<i>Glyptocephalus zachirus</i>	84	<i>Oneirodidae</i>	66

<i>Ophidion scrippsae</i>	66	<i>Sebastes jordani</i>	71
<i>Ophiodon elongatus</i>	73	<i>Sebastes paucispinis</i>	71
<i>Orthopias triacus</i>	73	<i>Sebastes</i> spp.	69
<i>Oxyjulis californica</i>	76	<i>Sebastolobus alascanus</i>	72
<i>Paralabrax</i> spp.	74	<i>Sebastolobus altivelis</i>	72
<i>Paralichthys californicus</i>	83	<i>Sebastolobus</i> spp.	72
<i>Parophrys vetulus</i>	84	<i>Seriphis politus</i>	75
<i>Plectobranchus evides</i>	77	<i>Stenobrachius leucopsarus</i>	55
<i>Pleuronichthys verticalis</i>	85	<i>Sternopychidae</i>	39
<i>Poromitra crassiceps</i>	68	<i>Sternoptyx</i> spp.	42
<i>Poromitra megalops</i>	68	<i>Stichaeidae</i>	77
<i>Poromitra</i> spp.	68	<i>Stomias atriventer</i>	44
<i>Protomyctophum crockeri</i>	61	<i>Symbolophorus californiensis</i>	62
<i>Rathbunella</i> spp.	77	<i>Syphurus atricaudus</i>	85
<i>Ronquilus jordani</i>	77	<i>Synodus lucioceps</i>	48
<i>Rosenblattichthys volucris</i>	47	<i>Tactostoma macropus</i>	45
<i>Sardinops sagax</i>	28	<i>Tarletonbeania crenularis</i>	64
<i>Scomber japonicus</i>	79	<i>Tetragonurus cuvieri</i>	80
<i>Scopelarchidae</i>	47	<i>Trachipterus altivelis</i>	64
<i>Scopelarchus analis</i>	47	<i>Trachurus symmetricus</i>	74
<i>Scopelarchus guentheri</i>	48	<i>Triphoturus mexicanus</i>	57
<i>Scopeloberyx robustus</i>	69	Unidentified fish larvae	86
<i>Scopelogadus bispinosus</i>	69	<i>Vinciguerria lucetia</i>	42
<i>Scopelosaurus harryi</i>	48	<i>Vinciguerria poweriae</i>	43
<i>Scorpaenichthys marmoratus</i>	73	<i>Xystreurus liolepis</i>	83
<i>Sebastes aurora</i>	70	<i>Zaniolepis latipinnis</i>	72
<i>Sebastes diploproa</i>	71	Zoarcoidei	76

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$9.00. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Science Center are listed below:

- NOAA-TM-NMFS-SWFSC-258 U.S. Pacific marine mammal stock assessments: 1998.
J. BARLOW, P.S. HILL, K.A. FORNEY, and D.P. DeMASTER
(December 1998)
- 259 The Hawaiian Monk Seal in the Northwestern Hawaiian Islands, 1996.
T.C. JOHANOS, and T.J. RAGEN
(March 1999)
- 260 Stress in mammals: The potential influence of fishery-induced stress on dolphins in the Eastern Tropical Pacific Ocean.
B.E. CURRY
(April 1999)
- 261 Recent developments in population viability analysis, with specific reference to pacific salmon.
P.D. SPENCER
(May 1999)
- 262 The Hawaiian Monk Seal in the Northwestern Hawaiian Islands, 1997.
T.C. JOHANOS, and T.J. RAGEN
(June 1999)
- 263 Proceedings of the Second International Pacific Swordfish Symposium.
G.T. DiNARDO, (Compiler and Editor)
(June 1999)
- 264 A report of the Oregon, California and Washington line-transect experiment (ORCAWALE) conducted in west coast waters during Summer/Fall 1996.
A. VON SAUNDER and J. BARLOW
(August 1999)
- 265 The physical oceanography off the Central California coast during May-June, 1997: A summary of CTD data from pelagic juvenile rockfish surveys.
K.M. SAKUMA, F.B. SCHWING, D. ROBERTS, C. MOORE, K. BALTZ, and S. RALSTON
(September 1999)
- 266 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1985.
D.A. AMBROSE, R.L. CHARTER, and H. G. MOSER
(September 1999)
- 267 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1986.
S.R. CHARTER, R.L. CHARTER, and H. G. MOSER
(September 1999)
